No code studio for smart product creation

Jumpstart your project
Integrate technologies
Generate embedded software

KEY HIGHLIGHTS

- Develop your smart product with no code interface
- Create an Experience Mockup as the project shared reference
- Integrate your technology into a ready-to-use ecosystem
- Generate your product embedded software
- Train your AI and generate user data
- Connect easily with your other software frameworks

OVERVIEW

Jumpstart your project with a software studio for designers and developers to describe, share and develop your future product experience. BOWL Studio does not require coding experience – it is developed for designers, product owners or anyone who wants to be an experience maker. BOWL Studio gives you an easy access to a complete industrial software suite to develop your smart products.

ECOSYSTEM

BOWL Studio web app is the entry point to the industrial software framework, BOWL Software Suite. Using your future product description from Studio, BOWL Software Suite generates all software packages needed for both additional development and runtime. Your future product logic can be deployed on multiple channels including a virtual setup, a starter kit and your final product.

POWERED BY BOWL SOFTWARE SUITE

The BOWL™ development tool is based on a service-oriented architecture (SOA) model that can support complexity and agility in system development. In this model, software is designed and developed in the form of independent services that can be reusable and incorporated into new applications. BOWL Software Suite is not a stand-alone tool. It supports the integration of software produced with MBSE, UX, graphic or AI engineering tools. It also provides the ability to port and scale to production platforms.
