

# Combat proven **IMINT AI-Solution** for accelerated decision making

## 7 Best-in-class AI algorithms

Proprietary complex AI applications to automatically detect, classify and identify objects of military interest on very high resolution optical satellite imagery.

**Aircraft**

**Vessels**

**Helicopters**

**SAM/SSM**

**Armored vehicles**

**Tents**

**Civilian & Military  
vehicles**

**Constant addition  
of new detectors**

*Preligens' detectors have unmatched performance levels, thanks to continuous improvements*

### **Detection**

### **Classification**

### **Identification**

**High performing algorithms** that reliably and consistently detect, classify and identify observables of military interest **in a matter of seconds**.

**Data agnostic models** that work on all types of satellite VHR images (commercial & NTM), **regardless of the provider and the context** (urban, desert, snow, ...).

**Flexible deployment:** turnkey software (with analytics, dashboards, alerts,...) or docker containerized models, on premise or in the cloud, regardless of **your architecture**.

# Accelerate your intelligence cycle and detect weak signals

**ROBIN**, a unique data and sensor-agnostic, AI-enabled software to monitor all your sites of interest

« We are processing 11 times more data thanks to Preligens' software and we are able to focus analysts on high added value missions »

— NATO Commander, London
