Our story

Xavier Melin noticed that his six-year-old autistic daughter was **calmed** when she used a virtual reality headset. He has the intuition that he can help his daughter, and many other vulnerable people, if he manages **to develop an immersive, multi-sensory and easy-to-use solution**.

After 6 years of research, development and prototyping, his project has become a reality, bringing well-being and relaxation to more than 3000 users. Its 5 boxes diffuse in **360° hot and cold breaths, smells** in a perfectly synchronized way with the images and the sound diffused by the virtual reality helmet.

Key Points

In **hospitals** and **specialized institutions**, the experiments help patients, children or adults with disabilities **to get out of their daily lives**. A director of a residential facility for the elderly, speaks of "a magical solution that exceeds expectations".

The **care teams** also use the device to relax themselves, and feel good during or at the end of the day.
