

Actisol

Precursor & leader of cracking

Actisol accompanies you in your farming itineraries to enhance your soil capital while preserving the environment and reducing economic constraints.

The best experts in SCT (Soil Conservation Techniques) confirm that:

› The choice of ploughing tool is crucial for successful implementation.

› The possibility of working, depending on the case and the year, at different depths is important to avoid the creation of superficial compaction just as harmful as a plough.

Therefore, it appears that toothed tools are the ones that best meet the new goals of soil preparation. Actisol is the pioneer with 50 years of authentic cracking practice.

In the current environment, who would ignore the economic benefits of STC?

› Bring down twice as much land as ploughing, without having to hire casual labour.

› Reduce the fuel bill significantly.

› Free time to meet colleagues, listen to their advice, exchange and grow.

These benefits are reflected in the gross margin of the operation, as it is now assured that parcels managed «in simplicity» obtain returns comparable to those managed in traditional itineraries. STC often have a positive effect on the regularity of yields due to the rooting quality of the plants.

Actisol,
savings by
agronomy.

Actisol

A unique tooth: personalized itineraries

The users say: the Actisol tooth presents the adapted profile to solve each agronomic case which presents itself:

Scalp stubble at 5 cm depth, accelerate residue decomposition and make false sowing.

Incorporate plant cover or organic fertilizers.

Open the soil to ventilate it, but without disrupting the horizons, without disturbing the activity of the humeral surface layer, fauna or flora.

Crack the entire soil 25-30 cm to prepare for the rooting of crops, including the most demanding ones.

Prepare a constant thickness difference, re coated and levelled, both for a conventional seeding set and for a seeding set meeting specific SCT requirements.

In a nutshell, the versatility of Actisol is such that it reassures, saves time, saves material and enhances the soil capital.

AUTHENTIC CRACKING

Actisol

SPECIALIST IN PIONEER SOIL CONSERVATION TECHNIQUES

CROP CULTURE, VITICULTURE, MARKET-GARDENING

LEADER IN CRACKING

Take back
your soil
capital.

› Traditional intensification techniques do not respond well to the objectives of an agriculture more attentive to its environment than in the past.
Let's start by giving back to our soils the **fertility**, the **aeration**, the **suppleness** rather than the compaction, the crusting or even the erosion. **STC** is only one step towards fertility, but it is an indispensable step. Contrary to popular belief, this approach is within everyone's reach.

More and more farmers do not hesitate to **take a spade** and open by themselves a soil sample to decide how to give back its structure at the best cost.
You only need to want to respect the **living environment**, simply because each organism in the environment works **for free** for your soil capital!

Actisol

CROP CULTURE

The line was designed so that each farm, from the smallest to the largest, E.T.A and CUMA fully benefits from the agronomic work of the Actisol tooth. From the preparation of autumn and spring soil to stubble ploughing after harvesting through the destruction of plant cover, Actisol has been your partner for more than 50 years. You will appreciate Actisol also for its possibilities of aeration and regeneration of prairies in early winter.

— STUBBLE PLOUGHING, SCALPING, CRACKING

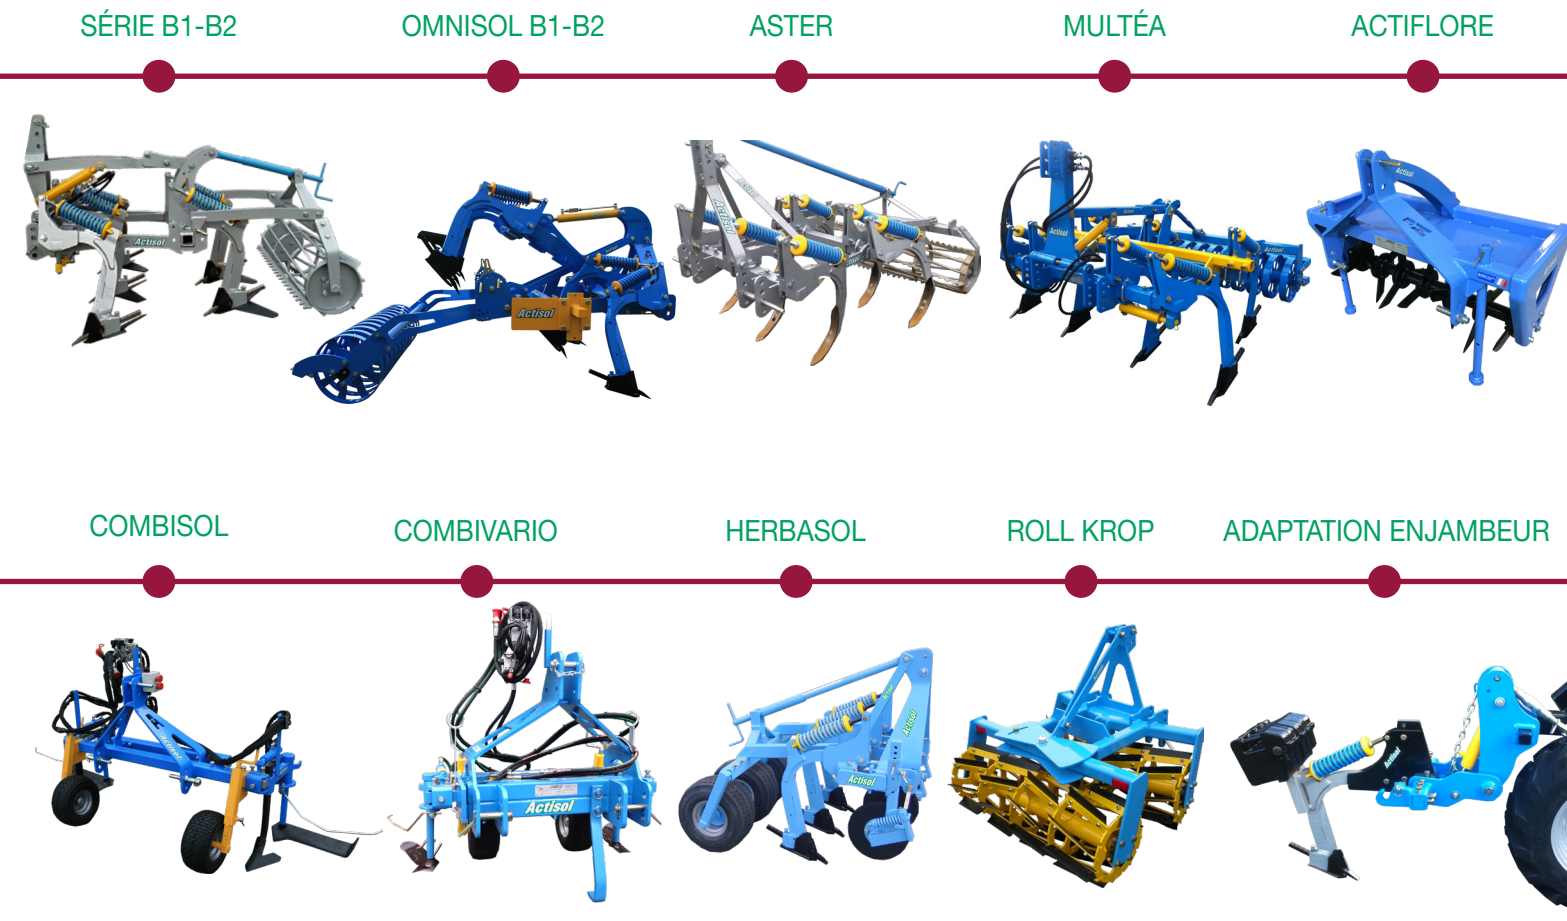

— GRASS COVER MANAGEMENT, PRAIRIE AERATION, STRIP TILL, MULCHING

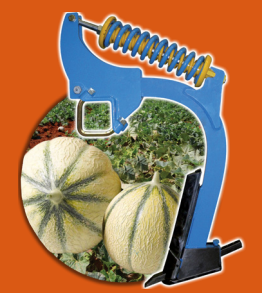

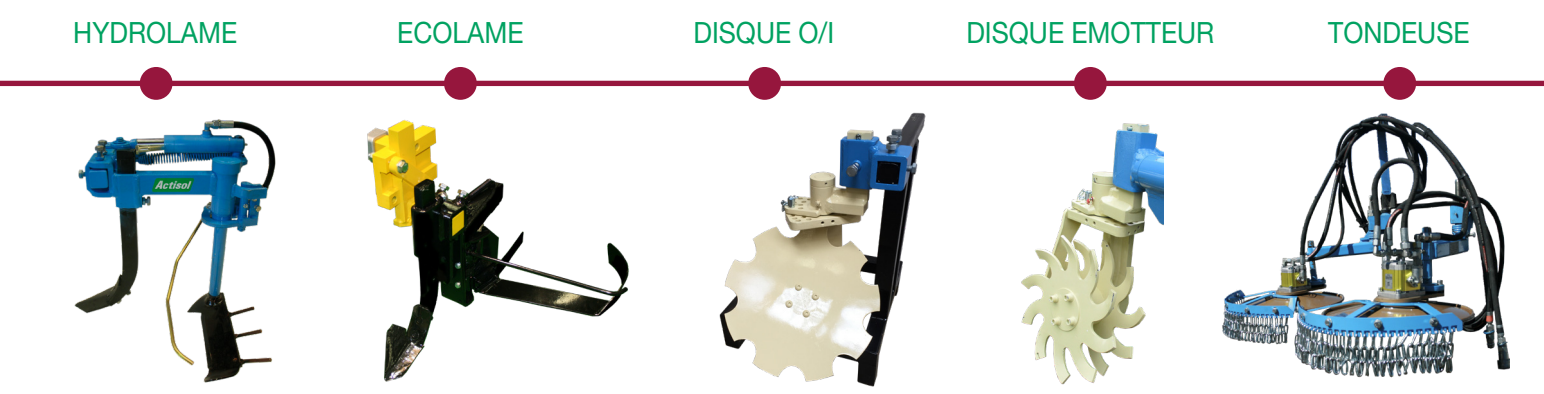

VITICULTURE

Actisol supports you in your quality approach at a time when growers are sensitized to traceability and to reasoned viticulture. From inter-rows to inter-plants, your vines are worked in accordance with your itineraries. The work of Actisol opens the possibility of reducing the dose of herbicides per acre and the number of applications.

— WORK OF THE INTER-ROWS

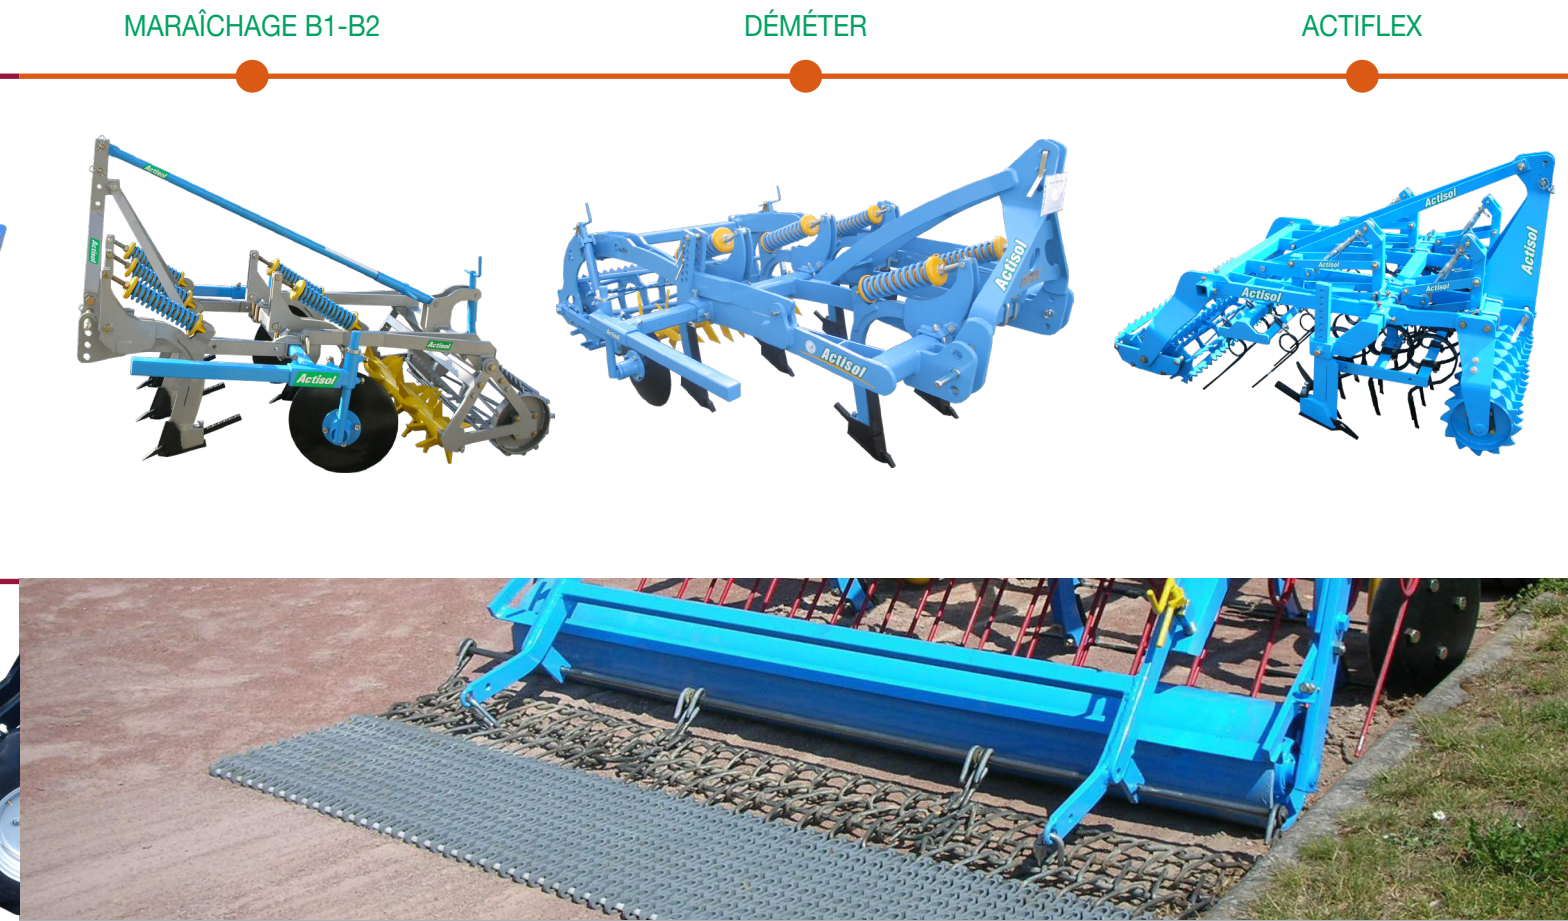

— WORK TOOL HOLDER OF THE INTER-PLANTS / ACCESSORIES

MARKET-GARDENING

Actisol repairs the structural damage caused by rotary tools (very good complementarity for growers using culti-rake and burier). The soil then benefits from drainage avoiding excess water and reducing the effect of diseases. Actisol Maraîchage is suitable for all market gardening, on the flat or on temporary or permanent beds.

— SOIL PREPARATION

— PRECISION MECHANICAL WEED CONTROL
