

# Saagie®

85% of data projects never reach production\*

Why? Because companies face 3 main challenges:

## Leverage a Large Technological Ecosystem

The ever-changing data landscape may be confusing and complexifies any technological choice as it offers countless frameworks that are hard to integrate and maintain. Saagie DataOps Orchestrator:

- allows you to integrate the best-in-class commercial and open source data technologies to seamlessly fit within existing workflows via Docker and Kubernetes;
- adapts to you infrastructure: multi-cloud or on premise.

## Accelerate Delivery with Process Automation

Most initiatives are handcrafted as companies tend to overlook processes. Saagie accelerates and allows you to scale the build and run of AI apps by automating workflows:

- The pipeline allows users to order their data processing operations by sequencing Data Scientists, Engineers and coders' work;
- The IT team gets a clearer vision of the project and the possibility to intervene at any step of the data lifecycle through notifications and APIs.

## Bring Alignment and Collaboration Among Teams

IT, data and business teams often find themselves working in silos. Saagie brings:

- Collaboration and consistency between stakeholders by providing an agile and easy to access environment to allow them to work together;
- A global project view to assemble teams and allow them to work with their favorite technologies.

## Why Choose Saagie DataOps Orchestrator?

### From POC to Prod

Starting from scratch, get your projects into production in **less than 10 weeks**

### Industrialisation

**3 times more use cases** are addressed in parallel by data practitioners with Saagie

### Autonomy

Reduce **technology lock-in** by choosing your technologies and deployment options

Predictive Maintenance

Customize Projects while Keeping Control

Saagie mainly relies on a smooth integration of open source components to handle DataOps throughout the entire data life cycle:

**Projects:** Manage data projects as a whole, from granting access to monitoring resources.

**Governance:** Gain and give access to datasets to the right people while being compliant with the latest regulations.
