Amélie Blaise
PARIS

Special collection

This new project was developed in collaboration with the teams of the Musée du Pays Châtillonnais / Trésor de Vix and the Bibracte archaeological site museum in Burgundy in France.

The tomb of the Lady of Vix was discovered in January 1953. It is the most prestigious princely burial place of the late first iron period (around 500BC). The Lady was lying on a burial wagon; she was adorned with precious jewels; among which a gold torque, a masterpiece of Celtic goldsmith's work. Next to her stood the famous bronze vase; its size is extraordinary (1.64m high) and of wonderful quality.

Amélie Blaise : « I approached this collaboration with great enthusiasm because I knew little about this historical period, but above all because I saw it as a challenge to confront an aesthetic and formal register that was a priori very far removed from my world. »

The designer chose to highlight the details of the filigree of incredible finesse and great richness of the crater and the torque. The technique of stamping with a mallet allows to highlight the relief of the manual work.

For this project, Amélie Blaise is also experimenting with a new material: high-quality marine leather produced locally in France from skins from the food industry that were initially destined for destruction, in an upcycling approach. The skins are carefully selected and treated using processes that favor vegetable tannins to minimize the environmental impact.

Collection available from September 2024.
