Abstract

The NECCTON Project

Stefano Ciavatta – Mercator Ocean international

The European and UN Decade NECCTON project is developing the unprecedented capability to predict marine ecosystems operationally. Its objective is to support the biodiversity and sustainable management of the oceans. We propose to engage the visitors of the pavillon on the vision and achievement of our project by means of innovative visualization and data processing tools developed by NECCTON. These tools include an interactive datacube and videos visualizing the narrative of our novel marine ecosystem model data products.
