# Faster than the hackers. With security audits and monitoring

## IT-Security-Monitoring in real time **Accelerate your cyber security process without effort**

Hackers scan the Internet for vulnerable systems every hour. At the same time, the number of new vulnerabilities published every day is increasing rapidly. What use are temporary pentests? The result is outdated the next minute. Automated security audits regularly check your company-wide IT landscape in real time, so you can easily keep an eye on the situation. You identify potential vulnerabilities immediately and are able to take proactive action.

In the event of security-critical changes, the notification function automatically sounds the alarm and takes you directly to the findings. This accelerates the optimization process and permanently minimizes risks.

### **Measure and prove IT security**

through continuous monitoring of enterprise-wide IT infrastructure

### **Proactively reduce attack surfaces**

through prioritized recommendations for action and integrated forwarding link to responsible IT admins

### **Detect anomalies and differences immediately**

through automated notifications and differential function in the report

### **Evaluate and compare the IT security situation**

using valid, traceable key performance indicators (KPIs) and optionally bookable benchmarks

### **Individual reports for management and IT**

with graphically visualized overview for management and detailed information for IT security managers

### **Meet security & compliance requirements**

through continuous risk management of suppliers and business partners

***"To minimize the attack surface, the number and variability of externally accessible systems must be kept low, and updates to operating systems and server and application software must be carried out regularly and promptly."***
