Motorized string disconnect
switch for emergencies

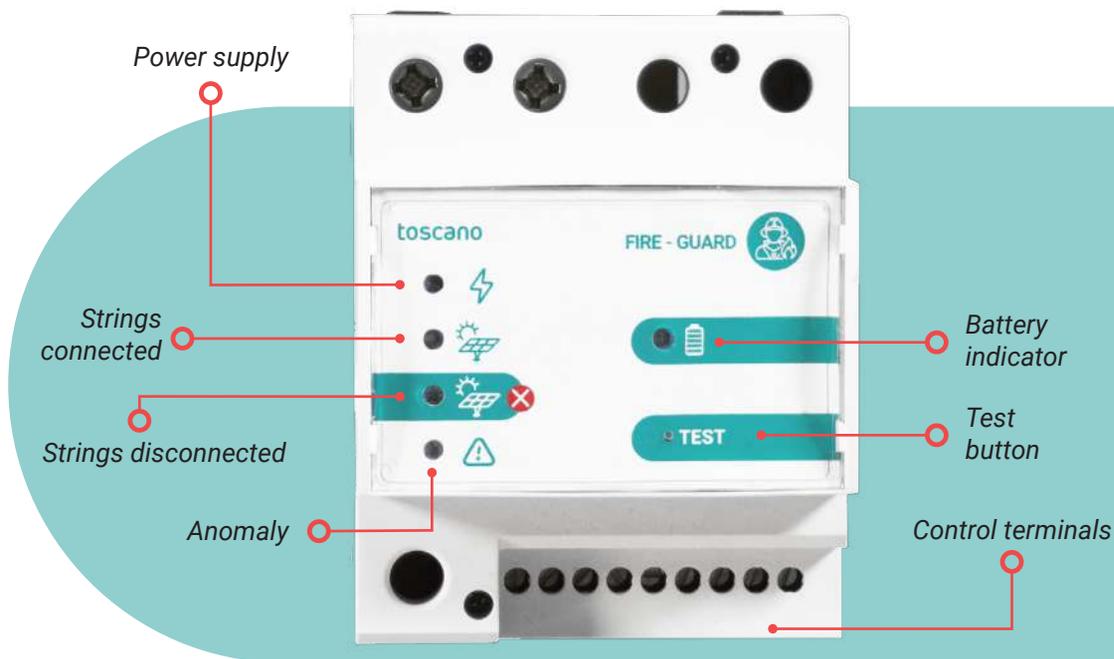

PV-FIRE-GUARD

vigivolt

Monitoring and control module for supervising up to **10 COMBI-PRO-FIRE units**, powered at **230 Vac** and featuring an internal battery to ensure operation in the absence of grid voltage. It allows **disconnection via an emergency stop button** and **integration with fire detection control panels**.

Equipped with **status signaling, anomaly detection protocols, and battery health diagnostics**. These features provide **continuous oversight to guarantee safe, fail-safe management of the electrical infrastructure**.

**Preliminary design: We reserve the right to modify this information without prior notice.*

FIRE-GUARD features

1 to 10 Strings

Centralized protection and monitoring of photovoltaic installations from 1 to 10 strings.

Modular device

This modular unit can be easily integrated into existing control panels.

Anomaly indicator

Visual indication of system faults or abnormal conditions.

Internal battery

Internal battery for operation in the absence of grid voltage.

Test button

Allows verification of the correct operation of the system.

Safe zone indicator

Visual indication confirming that the installation is voltage-free.

ECO-FIRE

Panel mounting options

Motorized DC disconnect panel (1000V / 63A) for string-level isolation in high-voltage PV installations. Designed for seamless operational continuity, the unit incorporates an automatic reset mechanism that **restores connection once safety parameters are cleared after a trip.**

It provides a breaking capacity of I_{cu} 10 kA and I_{cs} 7.5 kA, and incorporates a **Safety Lock** system that ensures safe and controlled disconnection, preventing unintended reclosing and guaranteeing reliable operation of the photovoltaic installation.

4-string configuration

Safety Lock

Prevents the device from automatically reclosing after a voluntary opening, in compliance with **UNE EN 60947-2:2018.**

1-string configuration

ECO-FIRE features

1 to 4 Strings

Suitable for the isolation and control of 1 to 4 photovoltaic strings.

Custom string configurations

Fully adaptable configuration designed to match the specific number of strings.

Connection type

Supports connection via MC4 connectors and screw terminals.

Fire Guard option

Optional Fire Guard integration.

How does it work?

1

EMERGENCY DETECTION

Designed for proactive safety, the COMBI-PRO-FIRE **automatically trips when ambient temperatures surpass 80°C**. It also provides versatile manual control through strategically placed **emergency stop buttons** or via the facility's fire management system.

2

DC DISCONNECTION

When activated, COMBI-PRO-FIRE **immediately disconnects the DC current**, isolating the rooftop strings and preventing the presence of voltage up to the protection panel and the inverter.

3

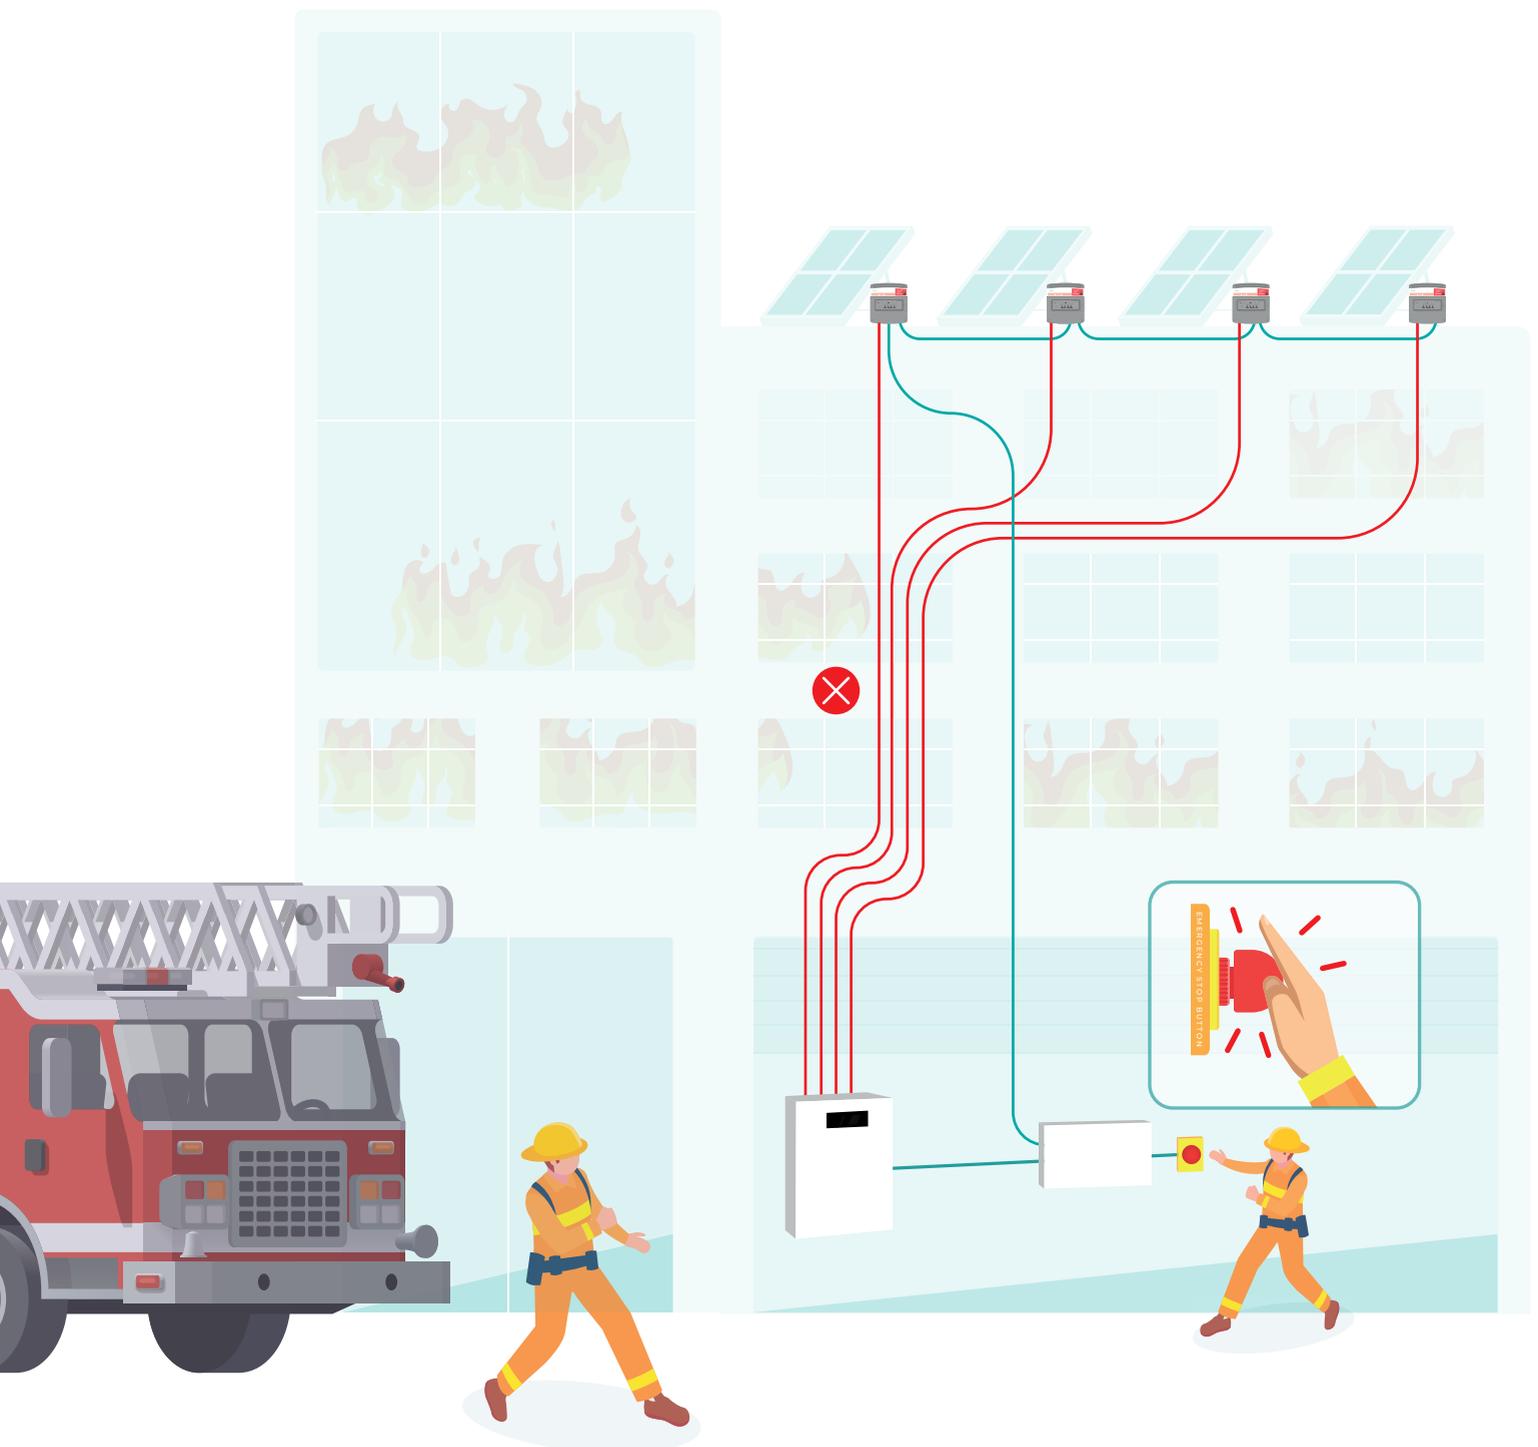

SAFE ZONE

By leaving the installation in a **DC voltage-free condition**, the presence of energy in the protected area is eliminated, ensuring an electrically safe environment for intervention.

4

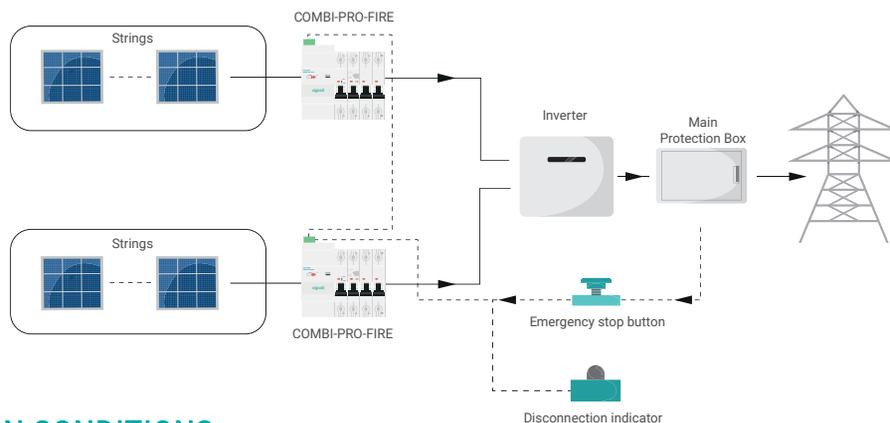

REMOTE OR MANUAL RECONNECTION

If the disconnection is **automatic**, the system will **reconnect remotely** once normal operating conditions are restored. **If the disconnection was manual**, for safety reasons, **reconnection must be carried out manually** by an authorized user.

OPERATION SEQUENCE

1 NORMAL OPERATION

2 ACTIVATION CONDITIONS

Over-temperature

If detected temperature exceeds 80 °C.

Emergency stop button pressed

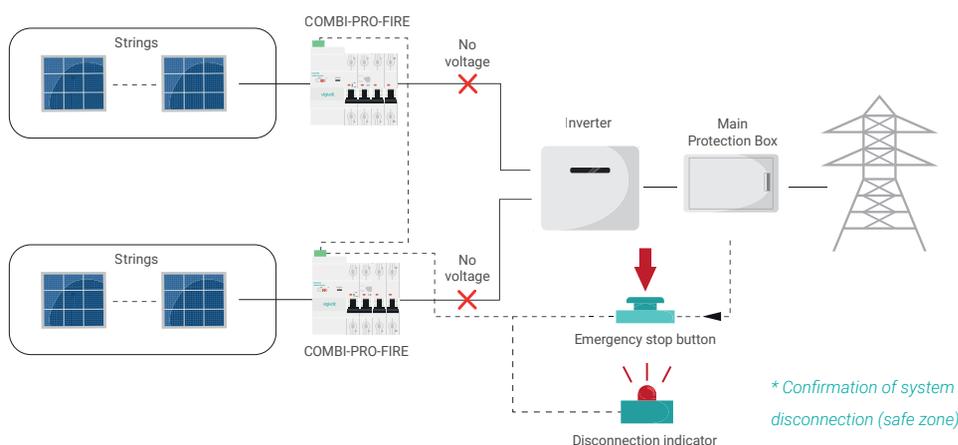

By pressing the emergency stop button from a safe zone.

Fire control panel

By manually disconnecting from the control panel.

3 PROTECTION ENABLED

* Confirmation of system disconnection (safe zone)

* Preliminary version: We reserve the right to modify this information without prior notice.

Models

COMBI-PRO-FIRE

Codes	References	Voltage
10005779	COMBI-PRO-FIRE-1000	1000 VDC
10005780	COMBI-PRO-FIRE-1500	1500 VDC
