MAIN TOPICS – NEW ENERGIES, AN INTEGRATED APPROACH

RENEWABLE ENERGY PRODUCTION

- ◆ High efficiency solar PV solutions
- ◆ PV everywhere
- ◆ Make the PV smart

ENERGY STORAGE & HYDROGEN VECTOR

- ◆ Batteries
- ◆ Hydrogen

ENERGY GRIDS

- ◆ Scenario study & analysis
- ◆ Optimal EMS design
- ◆ Digital tools & modelling
- ◆ Electrical conversion components & Systems
- ◆ Thermal systems for energy efficiency

CIRCULAR ECONOMY OF MATERIALS

- ◆ Strategic Materials recycling
- ◆ Materials Saving & Sobriety - Additive Manufacturing
- ◆ Environmental impact reduction

CARBON CIRCULAR ECONOMY

- ◆ Thermocatalysis / Thermoconversion
- ◆ (Photo) electrocatalysis
- ◆ Biology/ Biohybrides

- ◆ Sensors and system integration
- ◆ Non destructive testing
- ◆ Asset management
- ◆ Complex system optimization
- ◆ Decision making
- ◆ Prediction
- ◆ Vulnerabilities identification
- ◆ Secure Industrial IOT
- ◆ Anomaly-based network intrusion detection & reaction
- ◆ End-to-end encryption
- ◆ Trusted ledgers for data and service

CYBERSECURITY

RENEWABLE ENERGY PRODUCTION

1 High efficiency solar PV solutions

2 PV everywhere

3 Make the PV smart

Developing High efficiency solar technology
at competitive cost

Large solar power plant

PV Everywhere

Optimising PV systems efficiency

PV SOLUTIONS

- Large scale industrialization of heterojunction technology towards european eco-system
- Focus on the perovskite / heterojunction tandem technology as a long-term goal
- Increase efficiency by reducing electrical and optical losses
- Develop new PV modules high-level requirements
- Increase modules lifetime
- Imagine ecodesigned modules with low footprint from materials to end-of-life
- Optimize productivity by using digital tools for modelling, diagnostics and monitoring
- Adapt the system to include the flexibility needs

TECHNOLOGY

PILOT LINE
& PLATFORM

SHJ Pilot line

(Since 2005)

2020 - World Record
efficiency of **+25%**2020 - World Record
efficiency of **20% on an
11cm² module**

Perovskite platform

(since 2016)

- High efficiency SHJ cells
- High performances modules
- IEC-61215 & 61730 certification

Tandem technology :
silicon & perovskite

2018

**30% 2023 @cell level**

- High performances perovskite cells and modules (20% on 11 cm²)
- Stability assessment via specific materials encapsulation

TECHNOLOGY

SILICON HETERO- JUNCTION (SHJ)

Key Features

- **Top efficiency 25%**
- High quality materials
- Reduced number of process steps compared to upgraded standard technologies
- Use of ultrathin wafers (<100µm) due to outstanding surface passivation capabilities
- Compatible with advanced interconnection solutions (xBB)

Assets

- Bifacial cells and modules, with a low temperature coefficient
- Compatible with smartwire swct
- High throughput, High efficiency & Higher energy yield

Success stories

MEYER BURGER

SUCCESS STORY

SHJ CELL : NEW PV PRODUCTION SITE IN EUROPE

CEA and Enel Green Power have reached a heterojunction solar cell record efficiency of 25.0% active area (213 cm²) on M2 wafer on industrial pilot line at INES.

World-class result certified by CalTeC

<https://www.enelgreenpower.com/>

TECHNOLOGY PV EVERY- WHERE

Key Features

- Develop PV Technologies with high efficiency at competitive cost
- Custom Integration even with high-level requirements (weight, flexibility, irradiations...)
- Enables energy self-sufficiency

Success Stories

- Stratobus

DEFENCE &
CONSTRUCTION
Light modules (4 kg/m²)

MONITORING
Ultra-light modules (700
g/m²)

TELECOM
Stratospheric module

MARITIME
APPLICATION

ROAD INTEGRATION
Multi-use modules

High value-added segments
Highly positive externalities segments

SUCCESS STORY

STRATOBUS

CEA has developed for Thales a working module answering all requirements for a real stratospheric airship.

The next step will be the integration of modules on the Stratobus, an autonomous, multi-mission stratospheric airship, midway between a drone and a satellite.

<https://www.thalesgroup.com/en/worldwide/space/news/whats-stratobus>

TECHNOLOGY

MAKE THE PV SMART

Key Features

- **Software (SW) solutions for forecast & dynamic management (considering financial and technical constraints/objectives)**
- **Components sizing & system design :**
 - SW designed for various applications and requirements, including production prediction depending on the forecast
 - In-house libraries of models
- **Energy Management System (EMS) :**
 - Predictive and real-time control strategies
 - Mathematical optimization methods
 - Information system for feedback of operating data and control

Success Stories

- PV production prediction - Steady Sun

**FROM LOCAL
TO GLOBAL**

SUCCESS STORY

STEADY SUN

Development of an algorithm for PV production prediction, at minutes, hours and days levels and according to different regions.

Different aggregation level

☀ Site, Region, Country

Time horizon

TECHNOLOGY

BATTERIES (FOR STATIONNARY & MOBILITY APPLICATIONS)

Key Features

- A positioning all along the value chain for 25 years
 - From materials to components and packs
 - Characterization & modeling
 - Electrodes, cells & modules
 - LCA/recycling
 - Safety

Assets

- A unique battery platform in Europe focusing on lithium-ion battery development (to boost battery performances, improve reliability and cut costs)
 - Including close relationships with industrial partners on all the value chain

Success stories

- Various battery experimentation projects: Mettalliance, Iveco, Renault...

PLATFORM

MATERIALS & TESTS PLATFORM

Materials Synthesis

Characterization from nanoscale to system

TECHNOLOGY

BATTERIES

(FROM MATERIAL SYNTHESIS TO ASSEMBLY)

Key Features

- Li-ion, Li-metal, from gram to kg
- **Positive electrode material** : High voltage Spinel Oxides, High Capacity Layered Oxides; LiFePO₄ & other polyanionic materials, New cathode materials (rocksalt, glasses,...)
- **Negative electrode material** : High power/safety/lifetime, Ti-bases anodes, High capacity Si/C composites, Li metal
- **Electrolyte** : Liquid (salts, solvents, additives), Gel (i.e. Solgain™), Solid (polymer, inorganic, glass, hybrid)
- **Inks & electrodes** : mix (10ml to 60l)
- **Enduction** : lab coater, pre-pilot & pilot scale
- Assembly from button-size to dozen-Ah batteries

Assets

- Anhydrous lab (about 1000m²)
- Increase performances (power energy, durability),
- Decrease costs (economical, environmental, risks)
- Widen operational conditions (temperature, form factor)
- Beyond conventional Li-Ion Batteries : Many battery chemistries using Li ions or other ions (Na, K, Mg, Al,...), Different cell designs, Alternative processes

Sodium-ion

All solid state
(Li, Na)

Organic

Printed

Ni-based

Mg-, Al-, K- ion

Lithium-sulfur

Hybrid
Supercapacitors

Flexible

Redox Flow

Metal-air (Li)

Primary

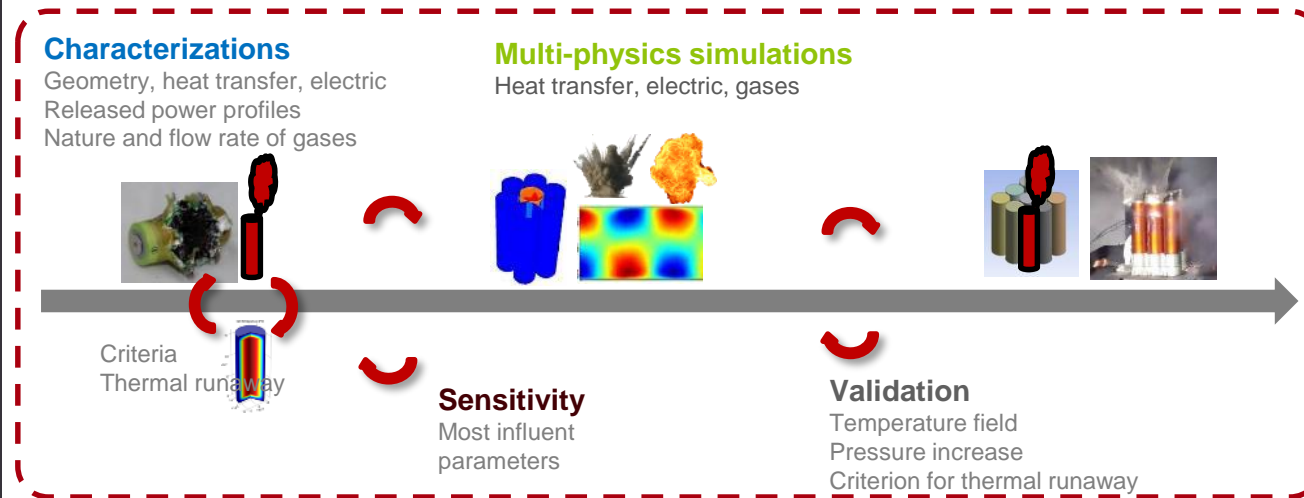

PLATFORM

BATTERIES (SAFETY TEST PLATFORM)

Key Features

- All kinds of abuse tests : **Electrical, Thermal, Mechanical**
- Systematic measurements (Voltage, current and temperature profiles, HD camera)
- Specific measurements and analyses (IR camera, Gas analysis, volume, composition Any other specific need...)

TECHNOLOGY

BATTERIES (MULTI-SCALE MODELLING & SIMULATION)

Key Features

Common approach for batteries and PEMFC - Close link between Modelling & Characterization

- **Model development :**
 - Truly multi-scale
 - **Multi-physics:** electro-chemical, transport phenomena, heat transfer, mechanics
 - Depends on the scale of interest & the issues at stake
 - **Predictive models :** Performance, Durability, Safety
- **Software development :** Development of reference codes, Interoperable codes, HPC computations

- **Database management :** Material and cell database
 - **Automation of Data collection,** Treatment for model parametrization, Analysis
- **Advanced experimental characterizations**
 - **Support to modelling :** Observation of the phenomena, Characterization of the parameters, Validation of the models
 - *Operando* and at all scales
 - World-class equipment and teams : CEA nano-characterization platform; ESRF Synchrotron ; ILL neutron scattering

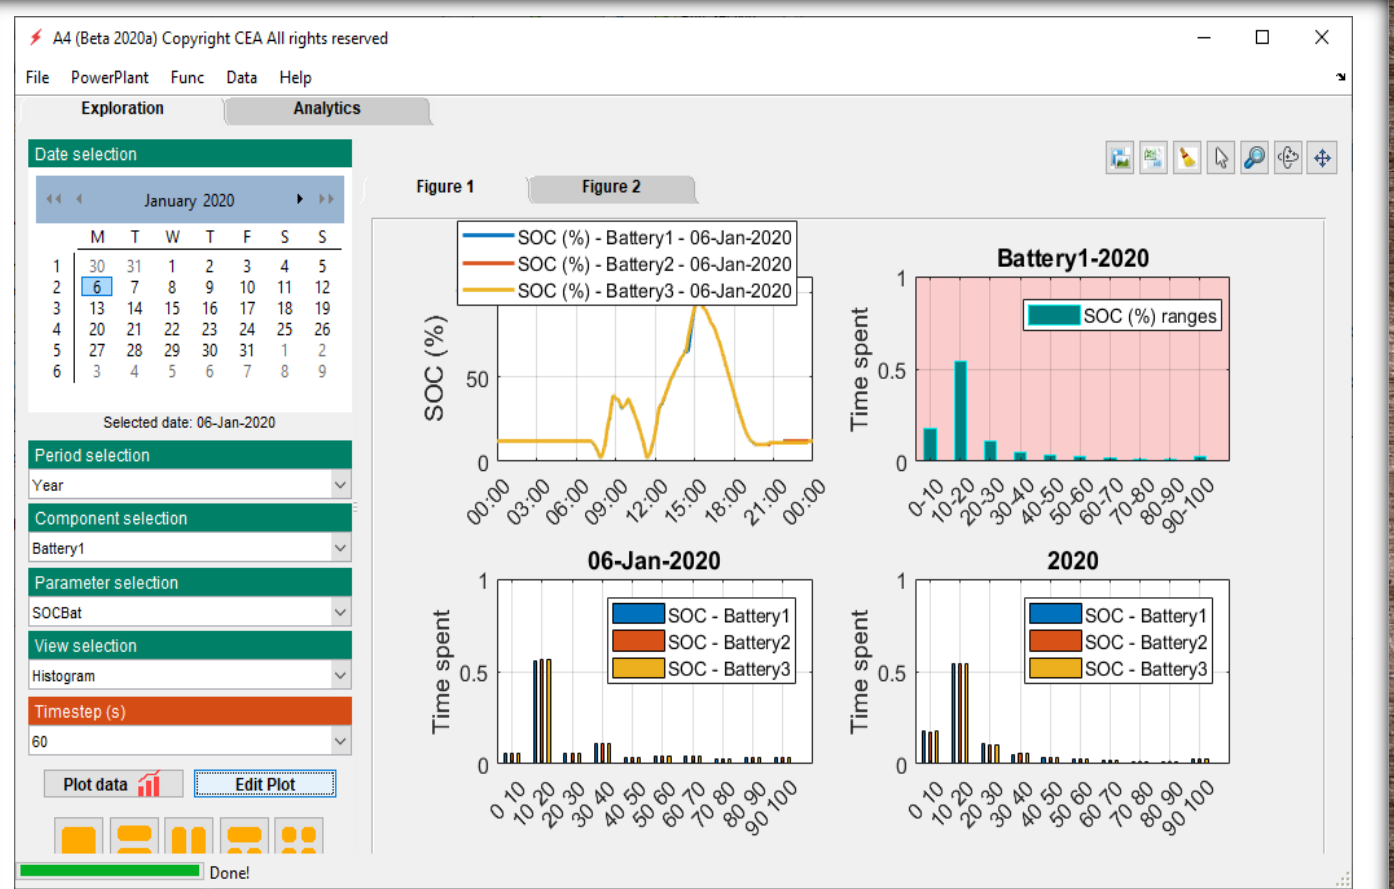

SUCCESS STORY

BATTERY ENERGY STORAGE SYSTEM (BESS)

BESS Management – Operation follow-up & predictive maintenance

- State, solicitation, diagnosis and health indicators implementation, tracking and analysis
- Control laws & strategies of use tracking and analysis
- Maintenance operation forecasting & planning
- Development of an algorithm for SoH calculation and other ageing markers
- SoH extrapolation to calculate the remaining lifetime

ALBIOMA

SUCCESS STORY

AEROSPACE : SAFETY FIRST AT A COMPETITIVE COST

Battery packs design for aerospace applications where safety is one of the top priorities

Hybrid E-Fan Plus
Batteries for hybrid-electric planes
Oshkosh, Wisconsin USA
July 2016

CityAirbus
Batteries for eVTOL

TECHNOLOGY

SIGMA CELLS (COMMUTED ARCHITECTURE)

otonohm

SWITCH **ESS**

Key Features

- BMS function with reconfigurable architecture, enabling chargers and engine inverter functions
- Signal generator
- **Continuity of service with deficient cell(s) isolation**
- Up to 20% autonomy
- Increased battery life (up 15%)
- For stationary or nomadic storage

Assets

- Technical means at the best worldwide level
- Skills across the entire value chain (from the electrochemical cell to the full system)

Success stories

- Nomadic application - Otonohm
- Stationary application - SwitchESS

Hydrogen production by electrolysis

High-Temperature Electrolysis (HTE)

↓ Levellized Costs of H2 (LCOH)
↓ Environmental Impact (LCA analysis)

↑ Durability
↑ Safety - Reliability

Hydrogen transport

Hydrogen embrittlement

Hydrogen Carriers

↑ Safety - Reliability

↑ Safety - Reliability

Hydrogen storage

Hyperbaric storage for transport

Liquid massive storage

↓ Levellized Costs of H2 (LCOH)
↓ Environmental Impact (LCA analysis)

↑ Durability

HYDROGEN ACTIVITY AT CEA

From production to transport, storage and conversion, CEA works on the whole value chain.

*PEMFC : Proton Exchange Membrane Fuel Cell

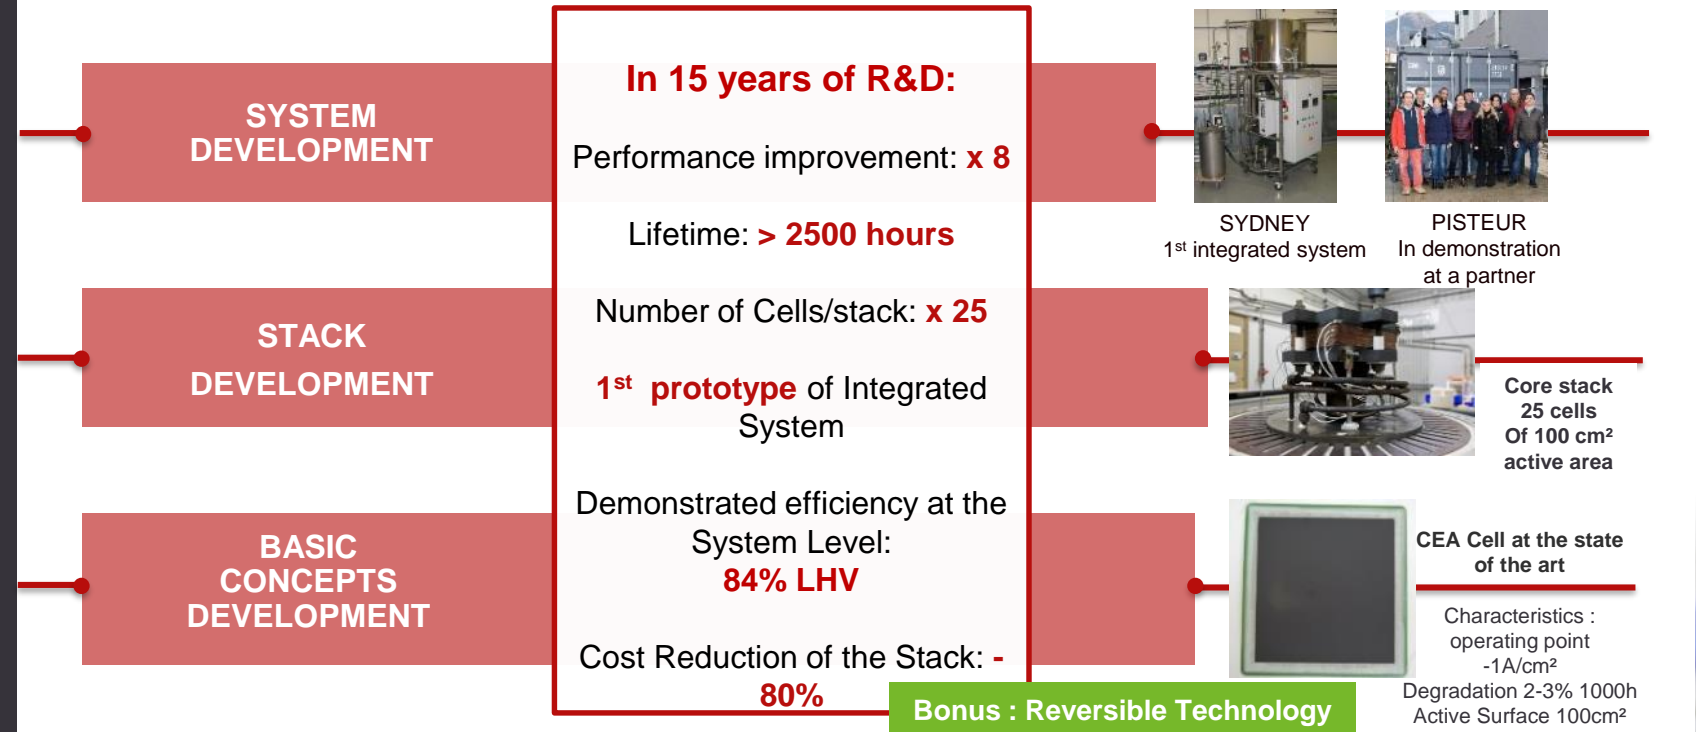

*SOE : Solid Oxid Electrolysis - HTE

*SOFC: Solid Oxid Fuel Cell

TECHNOLOGY

HYDROGEN PRODUCTION (HIGH TEMPERATURE ELECTROLYSIS)

CARBON-FREE HYDROGEN PRODUCTION

Background Patent Portfolio PI:
More than 40 patent family

PLATFORM

HTE TESTING EQUIPMENTS (PERFORMANCE AND DURABILITY)

Key Features

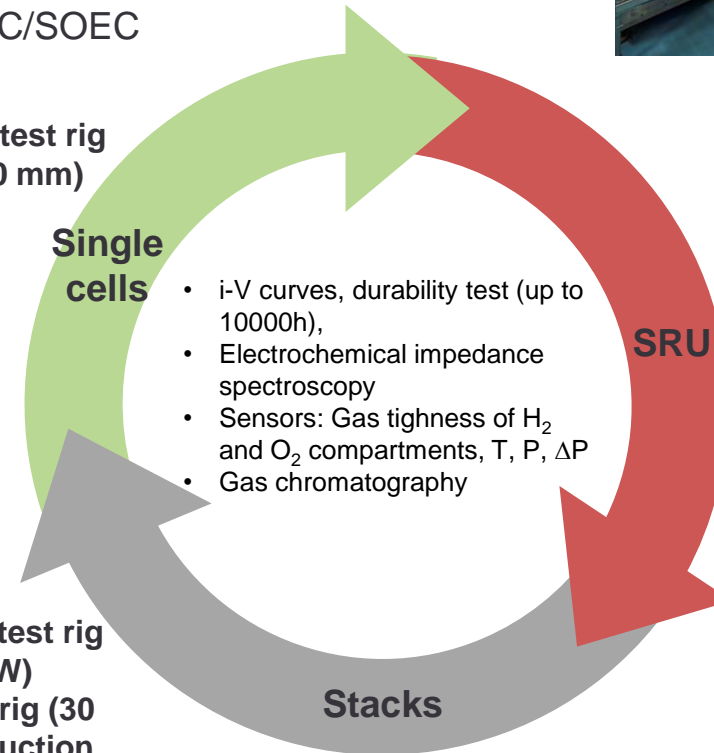

- System test : up to stack box 100 kW
- Characterization of BoP components and of the behaviour of the stacks in real environment
- System able to operate in SOEC, SOFC, and reversible SOFC/SOEC

Electro-chemical test rig
(Single cells \approx 50 mm)

Electrochemical test rig
(large stacks 6 kW)
Pressurized test rig (30 bar) upon construction

Pressurized test rig
30 bars

Electro-chemical test rig
(SRU and small stacks 3 kW)

TECHNOLOGY**HYDROGEN
PRODUCTION
(HIGH
TEMPERATURE
ELECTROLYSIS)****Key Features**

- Clean Hydrogen efficient production technology (84% LHV efficiency at 700°C) with a low environmental impact via high temperature steam electrolysis
- Building a strong HTE French ecosystem with the first up-to-scale 300 kW demonstrator in 2023.
- Industrialisation of the reversible technology (HTE) also able to operate in reversible mode
- The main objective is the launching of a Gigafactory in 2025

Assets

- 15 years of expertise in HTE

Success stories

The Genvia joint venture will focus on the development and industrial deployment of a game-changing electrolyzer technology for clean hydrogen production

Schlumberger

TECHNOLOGY

CHEMICAL

HYDROGEN

STORAGE

& TRANSPORT

Key Features

- Hydrogen is chemical bonded to an organic or inorganic material for safe storage
- Solid storage using lightweight element B, Mg, Na, N...
 - H₂ yield up to 12 %, stable at 85 °C, low impurities, easy novel synthesis
 - Hydrogen is released by thermolysis or hydrolysis
 - Assessment of product synthesis reliability
 - Using by-product to optimize the circular economy of hydrogen by enhancing product regeneration at competitive cost
- Liquid storage using organic molecule
 - liquid at atmospheric conditions, no H₂ gas, no loss during storage, Low toxicity, non-explosive and non-flammable liquids.
 - H₂ routing involves transporting a liquid using existing or dedicated infrastructures dedicated to liquid transport
 - New CEA molecule, efficient catalyst and optimized reactor

Assets

A full suite of tools and expertises to develop materials (molecule, catalyst, chemical processes...) and tank/reactor design with LCA / economical assessment.

TECHNOLOGY

HYDROGEN STORAGE & TRANSPORT (GASEOUS STORAGE)

Key Features

- Design of H₂ Composite Vessels and abusive testing for gaseous storage
- Type IV tank set up and structure
- Liner (function : H₂ tightness)
- Composite Overwrapped Shell (function: pressure withstand)
- **Type IV tank design and calculation**
- Abaqus (2D & 3D finite elements)
- + Compositcad (fibers trajectories calculation)
- + CEA Customized Plug-in FiWiQus®
- **Multi-instrumented test** : pressure, temperature, optical fibers, strain gauges, acoustic emission, LVDT, fast camera, 3D digital image correlation

Assets

- **Expertise & Testing Facilities** : impact, burst, drop (up), leak (bottom), fire (up), Guntest (Bottom)

TECHNOLOGY

THE CATHARE CODE (FOR HYDROGEN APPLICATIONS SIMULATION)

Key Features

- **Thermal-hydraulic simulation of multiphase flow dynamics**
- Code for thermohydraulic analysis, fluid flow simulation in industrial processes
- Used for the design, the safety assessment and real time simulation of **complex systems**
- Support REFPROP database for dealing with different fluids (H₂...)
- Safety in cryogenic conditions : Sizing of the safety device & Thermal flux arriving on the cryogenic components
- Performant & user-Friendly HMI « GUIHARE »

Assets

- 40 years of development
- Thermal-hydraulic simulation at system and component scale of multiphase flow dynamics
- Safety analysis and design purpose – plant or components
- Quantify the conservative analysis margins
- Define and verify emergency procedures
- Specific module developments and CATHARE code licencing

TECHNOLOGY

HYDROGEN STORAGE & TRANSPORT (EMBRITTEMENT)

Key Features

- Analysis of Hydrogen embrittlement (HE) on metal under Hydrogen gas or gas blends pressure
- Quantification & understanding of mechanisms observed under H₂
- Interactions between H and dislocations / vacancies / microstructure (traps) , consequence on mechanical properties
- H content in the micro-structure
- Impurities & gas mix effects
- Lifetime prediction (development of criteria, modelling)

Assets

- A full suite of tools and expertises to study possible embrittlement phenomenon on materials

Success stories

- Hydrogen embrittlement in pipes
- Mathryce European project

Mechanical testing up to 40 MPa bar H₂

Disc test < 100 MPa H₂

SUCCESS STORY

HYDROGEN EMBRITTLLEMENT IN PIPES

Impact of hydrogen embrittlement on steel, at lab and industrial scales. Understanding the impact of natural gas and H₂ mix on networks components and pipes.

TECHNOLOGY

HYDROGEN CONVERSION (PEMFC)

Key Features

- 4kW/L stack
- 700W/L system

Assets

- A fuel cell platform with advanced technologies and flexible processes that meet manufacturers' unique prototyping needs: from ink formulation to system integration & durability tests
 - 500sqm space
 - 6M€ investment
 - 20 test benches
 - 10 to 20 patents/year
 - More than 10 industrial partners

Success stories

- Main CEA achievements in terms of system integration
- Future development roadmap CEA-Symbio

SUCCESS STORY

ENERGY OBSERVER

Energy Observer is self-sufficient in energy boat, with zero emissions. The CEA has developed a compact model of PEM electrolyser, which can produce up to 4 Nm³ per hour of pure hydrogen, and consumes 3.66 litres of deionised water per hour.

<https://www.energy-observer.org/>

Energy Observer

ENERGY GRIDS

- 1** Scenario study & analysis
- 2** Optimal EMS design : multi-scales, multi-vectors, multi-criteria

Strategic Expertise

Selection of the right technologies and preparation of master plans

Techno-economic feasibility study and design

Analysis of the innovative solution sustainability based on real-use concepts and apply relevant business models

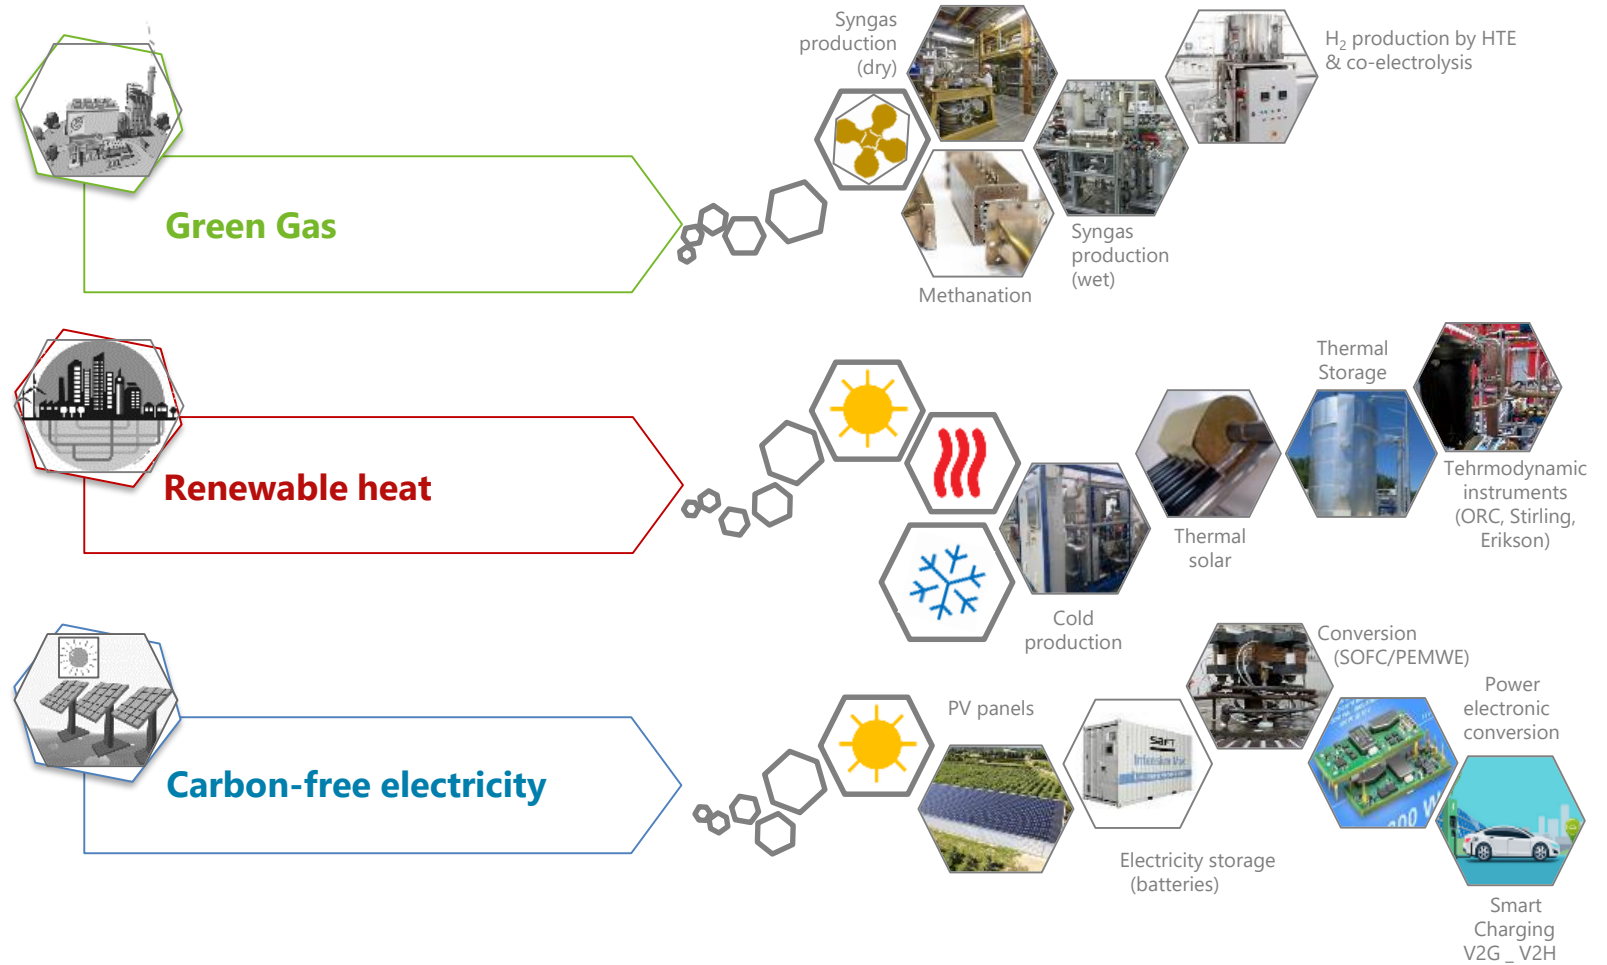

Regional demonstrators design

Up-to-scale demonstrators co-design, with management system, monitoring, and transfer to operators

ENERGY GRIDS AT CEA

With various competencies in conversion technologies, experimental platforms, demonstrators and digital tools, a unique offer to meet the energy transition of Territories and eco-industrial parks.

TECHNOLOGY ENERGY SYSTEMS (CONVERSION)

PLATFORM COMPLEX ENERGY SYSTEMS PLATFORMS

Already available :

PISE (Platform Smart Grid INES)
< 1MW – Multi-vector in a Semi-virtual environment

- « Control/Power hardware-in-the loop »
- Real-condition technical validation
- EMS & Systems testing
- Robustness to flaws, impact of real-time communication

Virtual Emulation Environment

Information System
Cybersecurity
Data management

Coming-up soon :

SMART CAD (Living Lab)
>10 MW – equivalent to 5000 inhabitants consumption

Existing uses monitoring, demonstrators
Consumption 40GWh gas, with 140 buildings, 113 GWh (eq.Aix-en-Pce), 200 VE with 110 charging points

- Slicing
- PV cells
- High yield
- Systems & grids
- Silicon crystallization
- BIPV buildings energy efficiency
- Mobility
- Solar
- Storage selection & system management

- Data acquisition
- Heat
- Electricity
- Cold
- Cybersecurity
- Natural Gas
- Electric vehicle
- Hydrogen
- Hydraulic network

TECHNOLOGY ENERGY SYSTEMS (TERRITORIAL DEMONSTRATORS)

- Injection into the gas network to supply a new district
- Natural Gas-H₂ fuel for GNV buses

- Control and sizing software creation
- Impact of Natural Gas-H₂ mix (SOFC, network materials compressors)

- Management of surplus from renewable energy production
- Massive storage of electrical power
- Gas network decarbonation

- Techno-economic study
- Demonstrator control tool

TOTEM

- 100% self-sufficient in electrical power
- Latest technology integration : electrolyzer AME 5 kW, PEM 10 kW, storage 100 kg H₂, 66 kWc of PV, batteries storage

- Advanced energy management
- Bifacial Heterojunction CEA technology - 9kWc

TECHNOLOGY SMARTGRID, CONVERSION & ENERGY EFFICIENCY PROJECTS

Heat network - Grenoble

Advanced Control

Behavior analysis
Dynamic modelling
Advanced management
Master plans
2016/2026

Grid flexibility

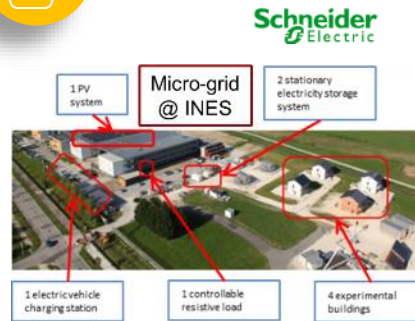

Power-To-Heat

District heat network heating & cooling for electrical grid flexibility
Advanced Control

District self-consumption

Advanced Control

Self-consumption PV : microgrid scale
Energy trade and selling thanks to self-consumption & according to the market

Distribution network management

Tension adjustment and peak shaving

Voltage regulation on a distribution network with PV with storage ; evening peak shaving

TECHNOLOGY SMARTGRID, CONVERSION & ENERGY EFFICIENCY PROJECTS

Already available :

Fast charging

Buses fast charging
Bidirectional charging
Sizing
Electrical architecture
Tests follow-up

Smart Charging

100% Solar Multiple Stations

Management of multiple Solar charging stations management
Regional scale optimization : Corsica

Building Energy Efficiency

Optimized design and management

Energy saving by innovative energy management systems and PV integration
Testing follow-up

Industrial Energy Efficiency

Renewable Energy integration in processes

Energy systems sizing
Techno-economic profit assessment

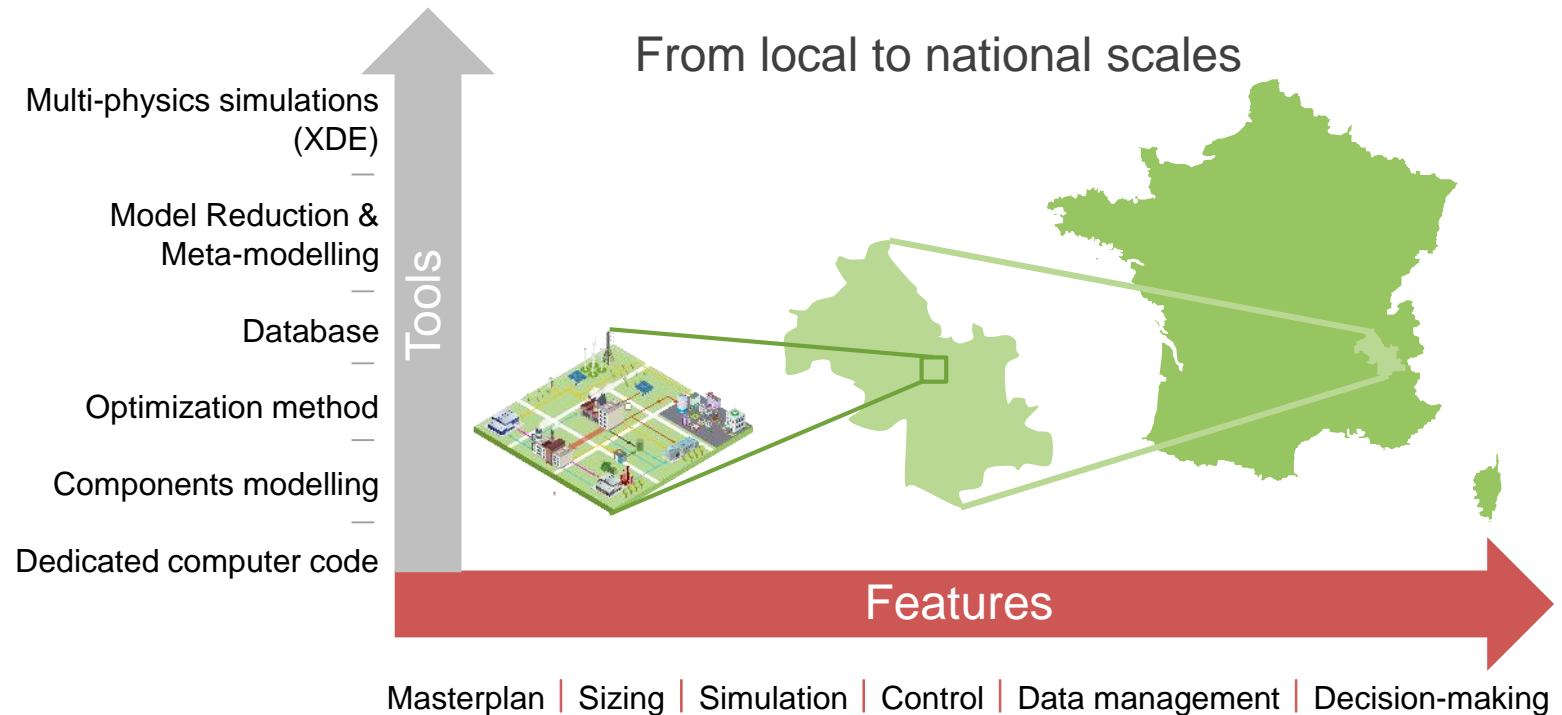

TECHNOLOGY

DIGITAL TOOLS & MODELLING

Key Features

- Digital tools for multi-scale and multi-vector energy systems,
- Modelling from components to systems and grids

CEA SYSTEMIC APPROACH

Idealization of industrial process energy optimisation

THERMAL SYSTEMS* FOR ENERGY EFFICIENCY

Energy Efficiency for industry:

- Waste heat recovery & use
- Thermal components development (heat exchangers, absorption cold production, organic Rankine cycle, heat storage)

TECHNOLOGY

EXPERTISE
IN THERMAL
SYSTEMS

Key Features

- **Thermal energy** : Heat transfer : conduction, convection, radiation
- **Thermo-hydraulics**: laminar, turbulent, two-phase flows,
- **Thermal and thermodynamic systems** : heat exchangers (heat transfer intensification and fouling), Organic Rankine Cycles, Absorption Cycles for heat and cold production
- **Simulation and experimental loops** : air, water and oil loops, heat storage dedicated loops at different temperature levels up to demonstrators (2MWh), instrumentation for different flow rates and temperature ranges
- **Complementarity with Nuclear Division expertise** :
- Thermomechanical behaviour and Mastery of usual codes (RCC-MRx, CODAP, ASME ...)
- Special Heat transfer fluids: supercritical CO₂, molten salts, Sodium, PbLi, Helium, Nitrogen

Asset

- Good knowledge of the industrial context in the thermal field : heat exchangers manufacturers and users
- Waste heat recovery and conversion

TECHNOLOGY

THERMAL
SYSTEMS
PLATFORMS**Heat transfer and Fouling**

- Performances and fouling of water/water heat exchangers 150°C, 10
- Performances of air/air or air/water heat exchangers, Up to 850 °C, A
- Particulate fouling of air/water heat exchangers, up to 150°C, air flow

**Heat Storage**

- Hot water tank for thermocline stability analysis
- Sensible Heat storage with rocks & oil (<300°C)
- Latent Heat Storage (from phenomenological loop with paraffin up to high temperature) steam storage 450°C)

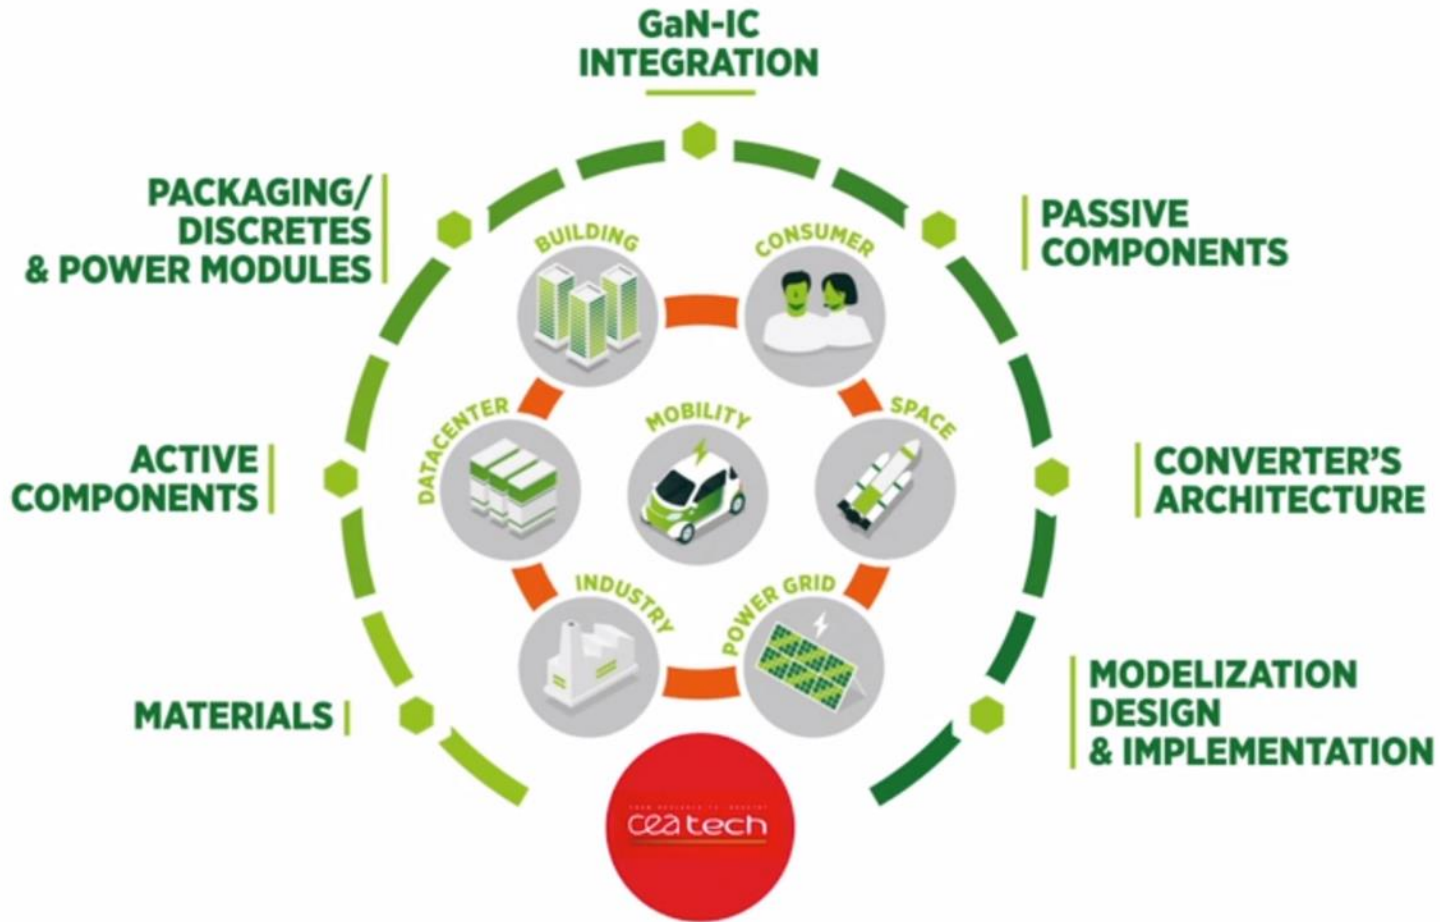

**Electronic cooling**

- Various industrial applications: batteries, LEDs, computers, vehicles, aeronautics, spatial (0 gravity) ...
- Various heat pipes configuration (capillary, pulsated)
- Ventilation, water circulation, PCM thermalisation

Asset

- **Highly accurate Instrumentation expertise with various fluids**

POWER ELECTRONICS

More than 150 researchers working on power electronics on 3 sites, with design centers, clean rooms, pilot lines, tests labs, labs for prototypes and experimentations indoors and outdoors

PLATFORM

POWER
ELECTRONICS
PLATFORM

Key Features

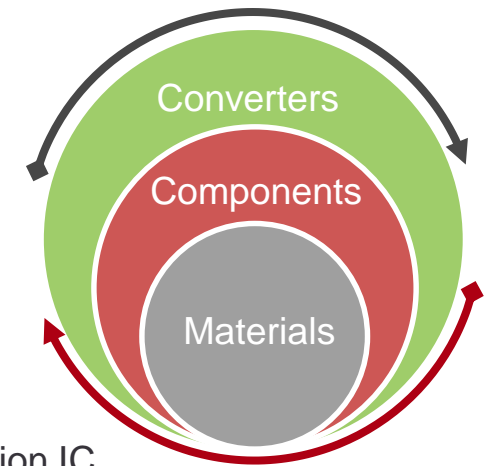

- **Power Electronics Platforms:**
 - 200 mm GaN epitaxy tool
 - Power GaN/Si technology (diodes and transistors)
 - Packaging & Power modules
 - GaN IC integration, SiC Smart Cut wafers
 - Electrical Characterization & Industrial Test (GaN, SiC, Si)
- **Converters :** for mobility, smart grids, datacenters : Increasing compactness and yield at competitive cost
- **Components :** Wide bandgap, passive HF, Packaging, Integration IC

Wide bandgap diodes & transistors, low loss HF transformers, integrated sensors for prognosis/diagnosis, packaging, IC and 3D integration, High power modules

- **Materials & Magnetic components :** Wide bandgap substrates, HF ferrites, 3D ceramics

GaN & SiC Wide bandgap substrate at competitive cost, disruptive wide bandgap (Diamond, ferrites for HF conversion, additive manufacturing, 3D ceramics)

Energy Transition

Digital Transition

Assets

- 3 sites with high expertise in power electronics : Grenoble, Chambéry & Labège

Success stories

- 2 start-ups created

TECHNOLOGY

POWER
ELECTRONICS
(CONVERTERS
FOR NTE)

GaN micro inverter for PV

- Power : 400 W
- Switching frequency : 200 kHz
- Power density : 1,1 kW/liter
- Input : 25-60 V_{DC}
- Output : 230 V_{AC} / 50Hz
- GaN based

Full SiC 5kW PV inverter

- Power : 5 KW
- Switching frequency : 200 kHz
- Power density : 1,1 kW/liter
- Input : 400 V_{DC}
- Output : 400 V_{AC} triphasé
- Full SiC 1 MHz et 10 kW/l

PV inverter 80 kW

Industrial Realization of a 1,7 kV / 100A Full-SiC CSI Module

- Power : 80 kW
- max. PV voltage : 1000 V_{DC}
- AC voltage : 690 V_{RMS} 3~ /50 Hz
- CSI topology
- Custom power modules
- SiC based (power-module 1700 V switches)

SUCCESS STORY

EXAGAN

Accelerate mass-market adoption of gallium-nitride (GaN)-based power devices.

STMicroelectronics acquired Majority Stake in Gallium Nitride innovator Exagan.

<http://www.exagan.com/en/>

life.augmented

SUCCESS STORY

WISE INTEGRATION

Ultimate Power Supply
miniaturization using custom GaN IC

Applications:

- Chargers
- In wall USB C charger
- E-mobility
- Data centers

MATERIALS CIRCULAR ECONOMY

- 1** Strategic Materials recycling
- 2** Environmental impact reduction
- 3** Materials Saving & Sobriety thanks to Additive Manufacturing

CIRCULAR ECONOMY OF MATERIALS*

Our aim is to find the economic and environmental sustainability in the Energy transition

PLATFORM

STRATEGIC MATERIAL RECYCLING

Recycling processes & critical metals recovery

Photovoltaic panels

Ag, Cu, Al

Permanent magnets

Rare-Earth materials

E-WASTE (PCB)

Au, Pd

Li-ion Batteries

Transitions metals, Li, Al

Fuel Cells PEMFC

Catalysts (Pt, Co), Nafion

Nuclear Fuels

Radioactive catalysts, Material Radionuclide

Development of hydrometallurgy processes

- Selective leaching
- Separation by continuous chromatography
- Recovery of particular interest items by selective precipitation
- Ionic liquids & molten salts
- Electrodissolution & Electrochemical reduction

TECHNOLOGY STRATEGIC MATERIAL RECYCLING

Key features

- Recycling processes development within one sector and multi-sectors
- Secondary deposit exploitation (Rare Earth, Co, Li...)

Pilot project of batteries recycling process

*New batch process (5L)
transferred to a partner
specialist in*

		Ni	Mn	Co
1 step	Purity	> 97,5%	> 96%	> 98,5%
2 steps	Purity	> 99%	> 99%	> 99%

Material composites recycling

*Support to our partner Extracthive for
Long fibers C recycling by solvolysis*

Hard magnet recycling (NdFeB)

*Re-melting and strip casting with more than
25% of recycled magnet reaches equivalent
performances than new magnets*

TECHNOLOGY

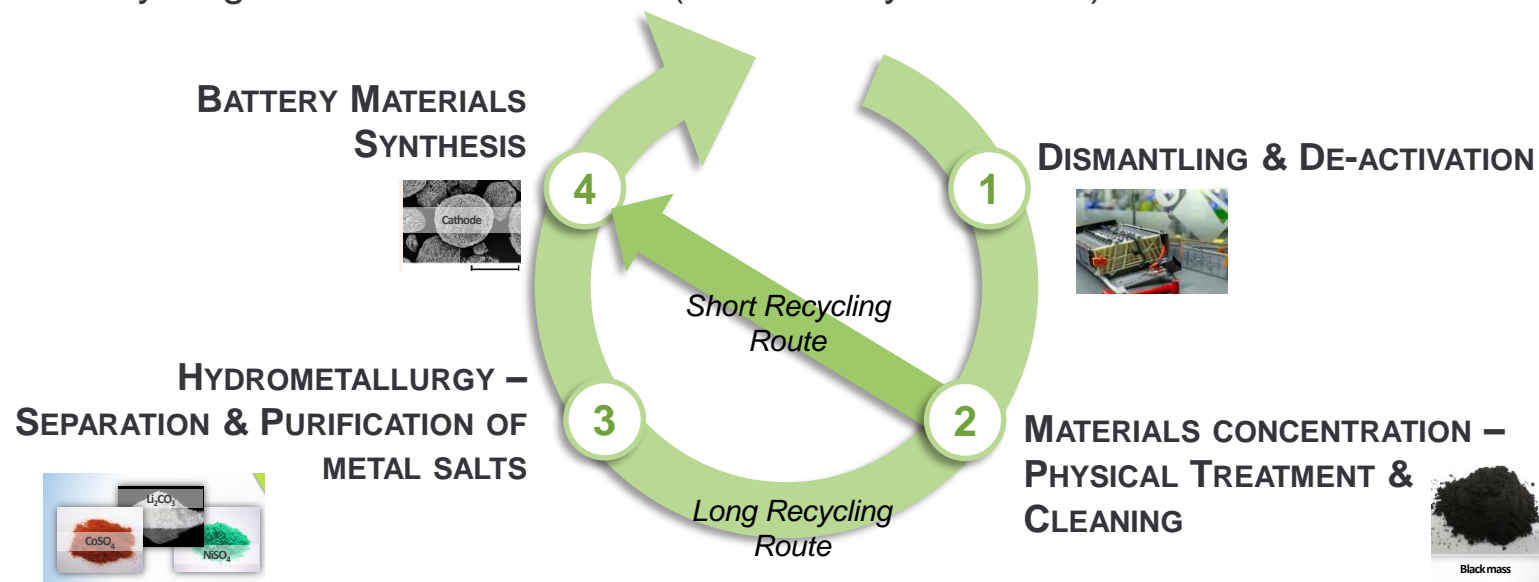

STRATEGIC MATERIAL RECYCLING (BATTERIES)

Key Features

- Joint laboratory with an industrial partner
- 4 main steps : deactivation, valuable metal concentration, hydrometallurgy and materials valorization

Assets

- Innovative recycling route
- Full hydrometallurgy processes
- Recycling materials valorization (new battery materials)

TECHNOLOGY STRATEGIC MATERIAL RECYCLING (PV)

Key Features

- Separation (wire slicing or supercritical fluid)
- Slicing and material concentration
 - Si Kerf : 35 % of losses
- End-of-life modules recycling
 - Layer separation
 - Wired Milling – Mechanical process
- Valorization & Treatment
 - Cost effective
 - Green
 - Innovative
 - Reuse of the liquid medium

Silicon cells

- Dismantlement
- Thermic treatment

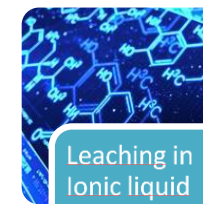

Crushing

Dealumination

- polyaluminium sulphate solution

Leaching in Ionic liquid

- Redox mediator
- Complexing agent

Electrowinning Silver

- Recovery of silver
- Regeneration of the mediator

TECHNOLOGY ENVIRONMENTAL IMPACT REDUCTION

Key Features

- Eco-innovation activities

Assess

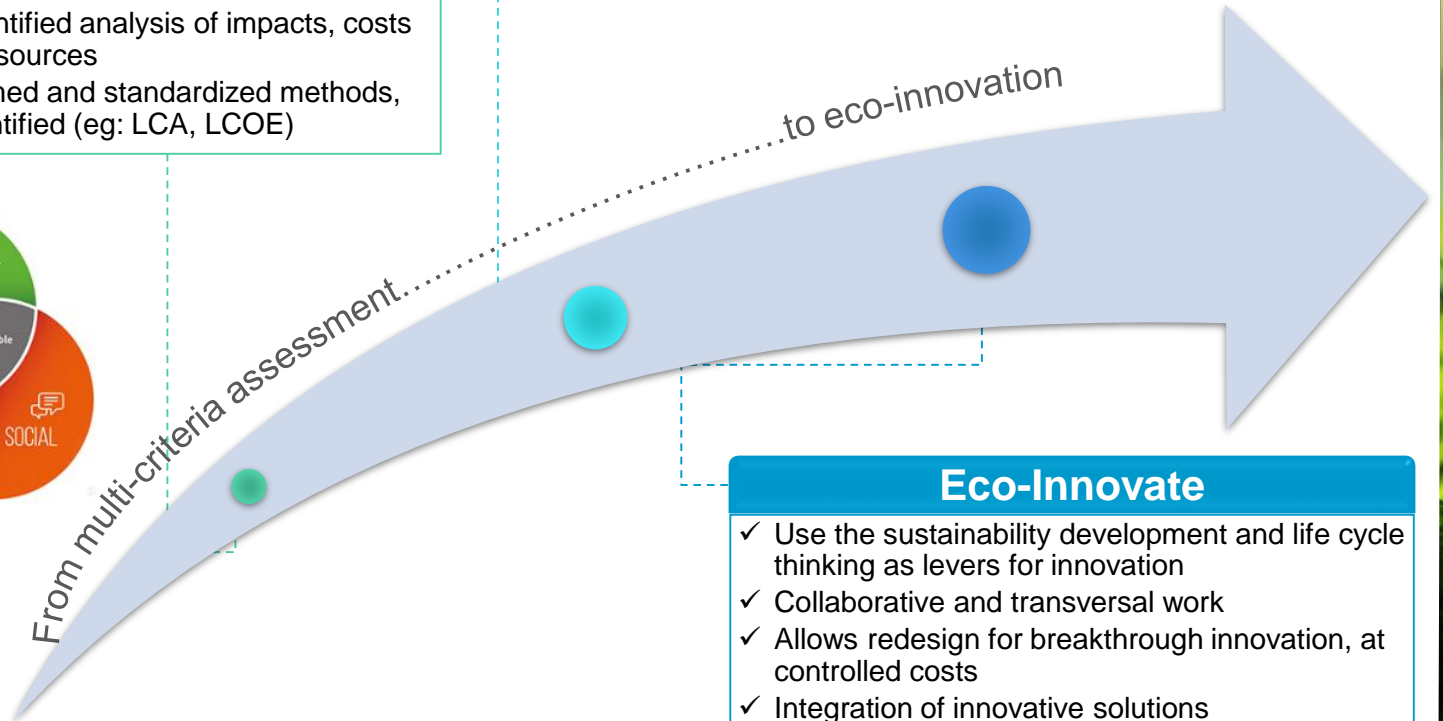

- ✓ Identification of issues approx. & eco of a domain
- ✓ Knowledge of technology issues and trends
- ✓ Quantified analysis of impacts, costs and sources
- ✓ Framed and standardized methods, quantified (eg: LCA, LCOE)

Improve

- ✓ Environmental and economic support for technical developments
- ✓ Eco-design and tech-eco optimization techniques
- ✓ Feedback on product, process and system design

Eco-Innovate

- ✓ Use the sustainability development and life cycle thinking as levers for innovation
- ✓ Collaborative and transversal work
- ✓ Allows redesign for breakthrough innovation, at controlled costs
- ✓ Integration of innovative solutions

TECHNOLOGY ENVIRONMENTAL IMPACT REDUCTION (REALIZATION)

Key Features

- **Evaluation of the different engines of a bus fleet:** 100% H₂, 100% battery, or Hybrid
- **Significant reduction in energy consumption and GHG emissions** from electrified battery and hydrogen solutions
- Increased investment in electrified solutions due to vehicle electrical storage and conversion components as well as charging and supply infrastructure
- Compensation possible by a reduced fuel cost in the TCO calculation, in particular if the taxation of fossil fuels is increased (taken at € 100 / ton in 2030)

TECHNOLOGY

SUSTAINABLE MATERIALS (MAGNETIC COMPONENTS)

Key Features

- **Magnetic components development for electrical motor**
- **Sintered Permanent Magnets design**
- Rare Earth reduction with new magnet compositions (Dy=-50%, Total Nd=-20%)
- Closed loop recycling with a Cradle to Cradle approach (up to 25% of used magnets incorporated)
- **3D design & fabrication for a higher compacity & power efficiency** by thermal cooling by 3D printing or injection molding
- Magnet, Rotor, Stator Casing

Assets

- **Expertise in magnet design with a reduction of rare earth elements content**

TECHNOLOGY

3D PRINTING (VALUE CHAIN COVERAGE)

Key Features

- A strong presence all along the value chain, from prototyping to mass production

DESIGN

- CAD models
- Simulation software's
- Process control software's
- Topological optimization

MATERIALS

- Polymers (binder, wire, powder)
- Metallic alloys (powder)
- Magnetic materials
- Ceramics and composites
- Recycled materials

3D PRINTING

- Powder bed fusion
- Stereo lithography
- Binder Jetting
- Fused Deposition Molding

POST-TREATMENT

- Thermal treatment
- Debinding and sintering
- Surface treatment
- Cleaning

CONTROL

- Non Destructive Control
- Chemical and Physical Properties
- Health Security Environment

- 3D@manufacturing base: AI & database for design of flawless spare parts
- 360° vision on Additive Manufacturing technologies
- Strong partnerships with key OEMs on disruptive technologies
- Industrial Ecosystems Animation on 3D Printing Polymers & Metals

Success Stories

- Additive manufacturing processes qualification
- 3D Print Ecosystem for the energy sector

Multi Jet Fusion
Polymers

PRODWAYS
Stereo Lithography
Polymers / Metals / Ceramic

Laser Beam Melting
Metals

TECHNOLOGY

3D PRINTING (EXAMPLE OF ACHIEVEMENT IN ENERGY)

Key Features

- Heat Exchangers & Reactors

Assets

- Complex design implementation
- Disruptive design for improved performances
- Easier manufacturing process
- Less assembly operations
- Embedded sensors
- Lower costs
- Lower leadtimes

*Thin channels and walls
(Source: CEA Tech/LITEN)*

*Complex absorption
exchanger reactor*

3D Printed Methanation Reactor

Sept 2020

*Methanation reactor and complex
internal structure*

**1st proof of concept designed and manufactured
with FAMERGIE multi-lasers LBM machine**

+ Complex channels design allowing better thermal control of the methanation reaction, improved heat exchanges, assembly operations reduction

CARBON CIRCULAR ECONOMY

1 (Photo)electrocatalysis

2 Biology/Biohybrides

3 Thermocatalysis / Thermoconversion

CARBON CIRCULAR ECONOMY*

- Some sectors will not be able to decarbonize only through electrification, hydrogen (H_2), or energy efficiency. Carbon will still be used.
- Complementarily to biomass, CO_2 must be seen as a resource, a substitute to fossil energy, in order to make these sectors sustainably decarbonised.
- To do so, low-carbon energies are combined with innovative CO_2 conversion technologies to produce fundamental molecules for energy and chemistry

➤ 2050 Objectives (SNBC)

Reducing Energy consumption to 1 060 TWh

- ➔ 580 TWh from electricity
- ➔ 480 TWh other – including non-fossil carbon molecules

TECHNOLOGY (PHOTO) ELECTRO- CATALYSIS

Key Features

- **CO₂ and water co-electrolysis for C1 or C2+ molecules production** (methanol, syngas, acid)
- Alternative liquid media: ionic liquids, Deep Eutectic Solvents
- **Artificial photosynthesis (solar fuels)** : photo-electrocatalysis (TRL 1-4)
- H₂ production
- Towards carbon molecules through direct conversion
- **Improve reaction efficiency** (Materials and catalysts development)
- Using non-critical metals & materials
- From multi-scale modelization to prototype development

Assets

- **First bioinspired photoelectrocatalytic cells realized in France, with the collaboration of a Japan team, with a successful production of H₂. The next step will be the CO₂ reduction.**

TECHNOLOGY

BIOLOGY

BIOHYBRIDES

APPROACHES

Key Features

- **Microorganisms biological strains expertise & engineering** (bacteria, cyanobacteria, microalgae) including metabolism, genetic engineering, lipidomics...
- Cultivation processes and conditions
- Pilot-scale (photobioreactor), GMO-compliant, modular and characterization platform
- Extraction and separation processes
- Application such as production of biofuels, biopolymers, terpenes, alkenes

Asset

- **Assess and engineer strains** according to application criteria and process constraints with optimal production yield
- **Pilot-scale units for microalgae cultivation**, harvesting, pretreatment, extraction of biomass and conversion (from 1 to 100l/h)
- Development & Characterization Platforms

SUCCESS STORY

TOWARDS 3RD GENERATION BIOFUEL WITH MICROALGAE

Long-term collaboration for the transformation of the CO₂ by microalgae into synthetic products of interest such as 3rd generation Biofuel from renewable energy sources

PHOTOSYNTHETIC

Biofuels

Chemicals

TECHNOLOGY

THERMO-CATALYSIS

Key features

- Improved yield and compacity, thanks to reactor-exchanger design, optimised for heat control

Assets

- Know-how in reactor design in relationship with reaction kinetic and heat-exchange, modelling, sizing
- Platform for methane, methanol, hydrocarbons, CO and CO₂ (WGS and RWGS) etc.
- Components, system and technology coupling approach
- Academic partnerships on catalytic reaction kinetics and thermodynamics

Success story

- **Khimod:** HIP millistructured reactor for Power2X
- **Jupiter1000:** Power-to-Gas, first french industrial demonstrator

TECHNOLOGY

THERMO- CONVERSION

Key features

- High carbon conversion rate and high energy integration of biomass conversion into energy carriers and building block molecules
- Process adaptation for variety of resources
- Waste-treatment solution

Assets

- Platform for dry (torrefaction, pyrogasification) and wet (hydrothermal liquefaction and gasification) conversion
- High pressure and high temperature process know-how

Success stories

- **Pulp&fuel:** biofuel by hydrothermal gasification of black liquor, a pulp&paper waste
- **Gaya:** Expertise of gasification process, modelling and gas analysis

DE LA RECHERCHE À L'INDUSTRIE

DIGITAL TOOLS FOR ENERGY

Digital tools for Energy systems integration

Remote assets monitoring

Energy production prediction

Networks : Sizing, management (production, consumption, storage) & real-time control

Cybersecurity for energy networks and systems

Batteries operation modelling, V2G control

Industry Energy Optimization

Buildings Energy Management, V2H

Acquisition & treatment of data treatment, Big data

Consumption prediction

Digital Twin

Consumption prediction (heating, ECS)

- ◆ Sensors and system integration
- ◆ Non destructive testing
- ◆ Asset management
- ◆ Complex system optimization
- ◆ Decision making
- ◆ Prediction
- ◆ Vulnerabilities identification
- ◆ Secure Industrial IOT
- ◆ Anomaly-based network intrusion detection & reaction
- ◆ End-to-end encryption
- ◆ Trusted ledgers for data and service

SENSORS AT CEA

With strong expertise in microelectronics, CEA proposes various innovative sensors, and tailored solutions for energy challenges.

PLATFORM
MULTI-SENSORS PLATFORM

MEMS size mechanical part

Separate optimization

Nano-size piezoresistive gauge

- **Multi-sensors / Multi-axis**
- **Very Efficient transduction** (stress concentration)
- **Ultra-Miniaturized sensors**

200 & 300 mm Microsystems Clean Room

TECHNOLOGY

GAS

SENSORS

Key Features

- **NEMS-based Multi-Gas Analyzer**, based on Gas chromatography / mass spectrometry
 - Multi-gas
 - Resolution: few ppm to few 10's ppb
- **Low-power NDIR CO₂ sensor**
 - Low power consumption: < 1,5 mW @ 100% duty cycle
 - Small footprint (2x2x1 cm²)
 - Resolution: 10 ppm @ 1000 ppm concentration for CO₂ gas
 - Designed for CO₂ or CH₄
 - Reference channel
- **QCL Photo-Acoustic Spectroscopy**
 - Measurement of light absorption by the molecules of interests and the resulting acoustic waves
 - Assembling a quantum cascade maser (QCL) source and a photonic integrated circuit (PIC)
 - Low power consumption during operation (less than 10 W)
 - Suitable for continuous monitoring
 - Gas detected : methan, buthen, CO, CO₂, propan, ethylene...
 - Smaller and cheaper than current QCL technology
 - Up to 3 different gas detected at the same time
 - Limit of detection down to 1 ppm at 10mW

Success Stories

- APIX technology

- Start-up eLichens

- Start-up Mirsense – QCL sensors

PLATFORM

PRINTED ELECTRONICS PLATFORM

Key Features

- **A complete set of printing tools**
 - Gravure printing
 - Screen printers (x3)
 - flexogravure
 - Slot die
 - μ spray
 - Ink jet
- **On various substrate materials**
 - Metal, Plastics, Glass, Fabric, Paper
- **Characterization and post-processing tools**
 - Automatic Inspection
 - Ellipsometer
 - Pick & Place
 - Laser Ablation
 - Laminating
 - Thermoforming

SHM / sensors for Batteries

Wearable / Robotics

*Human-Machine

TECHNOLOGY

PRINTED PIEZO- ELECTRIC (FOR BATTERY SHM)

Key Features

- **Printed piezo can be used for Structural Health Monitoring**
 - Ultrasonic emitter/receiver (MHz range)
 - Determination of the State of Charge
 - Detection of abnormal behaviour (over charge, under discharge, over heating)
 - Prevention of safety issues
- **Co-Integration of multiple functionalities possible**
 - Conductive lines,
 - temperature,
 - Strain/stress sensors on the same foil
- **Easier Integration**
 - Piezopolymer thin and conformable compared to bulky and rigid piezoceramics
 - Integration in plastic casing
 - Integration directly on battery cell

TECHNOLOGY

AUTONOMOUS & LOW POWER SYSTEMS (USING ENERGY HARVESTING)

Key Features

- Development of autonomous IoT devices by using energy harvesting
- **Whole energy harvesting system** design for autonomous IoT devices
 - Mechanical energy (vibration, shock...), Air & Water flow, Heat Solar energy, MEMS systems, Microbial Fuel cells
- **Ultra-Low Power electronics**
- Optimizing the code and the microcontroller states to minimize its power consumption
- **Wireless Power Transfer**
 - Acoustic Power Transmission
 - Electrodynamic

Assets

- Whole system design & Advanced multiphysic systems
- Characterization equipment
- New components, new materials

Success stories

- Energy harvesting from water flow

InDeal

TECHNOLOGY SYSTEMS FOR COMPLEX ENVIRONMENT

Key Features

- **High Temperatures**
 - Autonomous sensors for aeronautics (180°C/20G) (energy harvesting, wireless power transfer)
- **High-G**
 - 3A @ 500'000G Datalogger
 - Shock Energy Harvesting @ 20'000G (shocks)
- **Constrained Environments**
 - Integration of data acquisition systems
 - Electronics & Mechatronics

3A 500'000G Datalogger

Cattle monitoring (T°, Acc)

Drop time of nuclear reaction control rods (3A – 200G/800Hz)

Shock Energy Harvesting (20'000G)

SUCCESS STORY

MORPHOPIPE

Analysis of deformation using data fusion algorithm.

Composed of an accelerometer sensors network, flexible and connected, for deformation analysis of a riser.

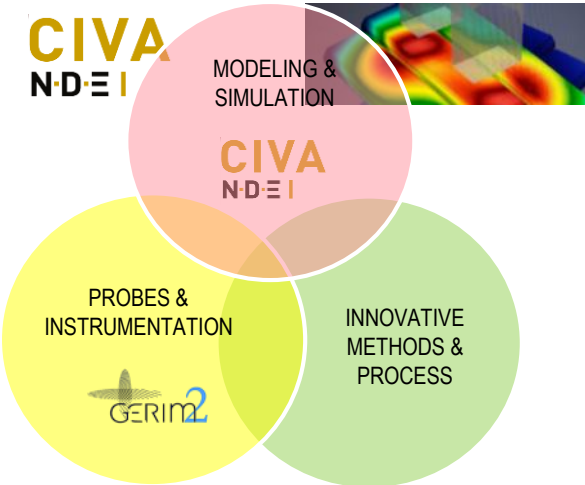

INSTRUMENTATION & CONTROL OF ASSETS

1 Sensors and system integration

2 Non destructive testing

TECHNOLOGY

NON-
DESTRUCTIVE
TESTING

Success stories

Key Features

- Numerical tools & simulation : Simulation, POD (Probability of detection), Imaging, data analysis & automatic diagnosis (AI for NDT), Optimization tools , Assisted NDT for operators (AR/VR)
- Instrumentation NDT : Flexible and adaptative sensors, embedded processing, real time imaging, Robotized NDT
- Technologies : Ultra-Sound, Eddy Current Testing, X-Ray, XR/CT, InfraRed Testing

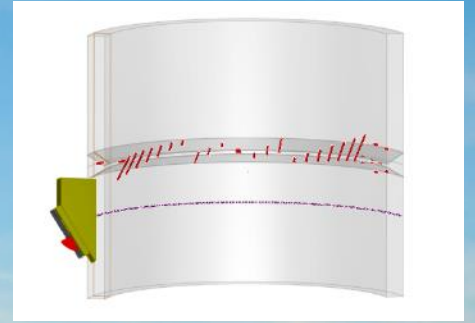

Assets

- Improving detection systems, developing embedded instrumentation and innovative solutions
- Modelling abilities possible with a powerful tool (CIVA) used in more than 40 countries
- Data analysis & diagnosis

SUCCESS STORY

USING ULTRASOUND FOR OIL & GAS MONITORING

- Evolving of current standard for the qualification of UT AUT inspection in the Oil & Gas industry
- Develop and promote simulation tools for qualification or validation of AUT inspection of welds according to evolving standards
- Collaboration with third parties DNVGL JIP to get recognition of AUT simulation
- Providing a CIVA AUT Oil & Gas module for AUT (Automatic UltraSonic Testing)

SUCCESS STORY

AUTOMATIC DIAGNOSIS FOR WELDING MONITORING

- Automation of the diagnosis of ultrasonic welds of an offshore wind farm
- Automatic generation of inspection reports
- Increased productivity and reliability
- Manual analysis: several months
- Automatic analysis: one day

Ocean Breeze

SUCCESS STORY

PIPE THICKNESS MAPPING IN THE ENERGY SECTOR

- Continuous monitoring of metal piping to detect and monitor corrosion
- Passive system based on the exploitation of ambient noise and ultrasonic guided waves
- Measurements obtained using two receiver rings
- Reconstruction of the thickness map (Passive Tomography)

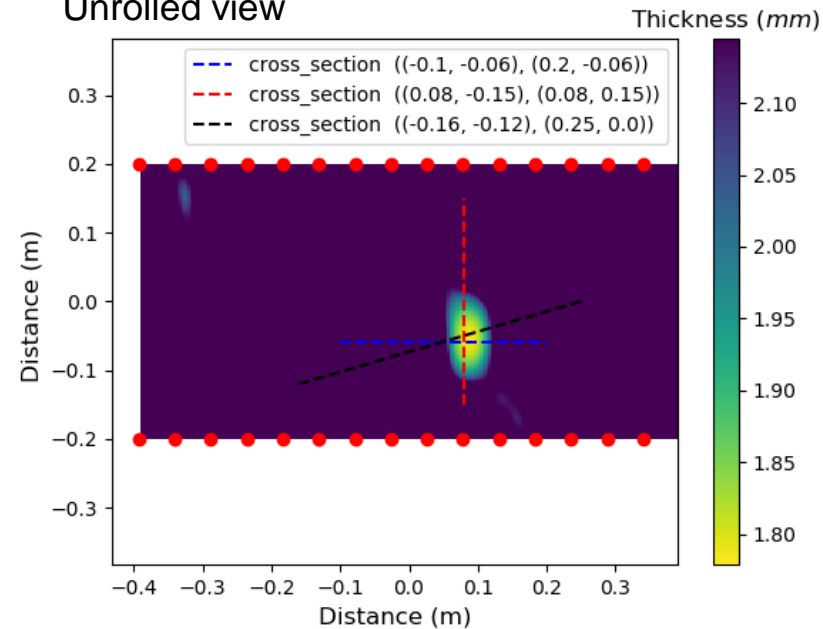

Electrolysis-induced corrosion

Passive reconstruction

Unrolled view

Cross section

TECHNOLOGY

NON-DESTRUCTIVE ELECTRICAL MAINTENANCE (REFLECTOMETRY & TRANSFEROMETRY)

Key Feature

- A specific test signal is injected down the cable:
- **Reflectometry**: reflected echoes at each fault are recorded for data analysis
- **Transferometry**: transmitted signals are recorded for data analysis.
- **Applications**: electrical cable diagnosis, cable/fault characterisation, ageing monitoring, network topology reconstruction, environment health monitoring, structures health monitoring, hardware integration

Asset

- Embedded diagnosis (i.e. electronic board, chip, etc.).
- Cable monitoring in real time with respect to EMC constraints.
- Detection even in hard-to-access areas
- Numerical tools & simulation to evaluate the performance of the reflectometry in different configurations (based on simulation/experimentation).
- **Reflectometry** : Enables fault detection and location even when the system is off
- **Transferometry** : Permits to overcome the signal attenuation in long cables and to monitor the cable aging

Success stories

- Electrical wiring systems troubleshooting, testing & monitoring

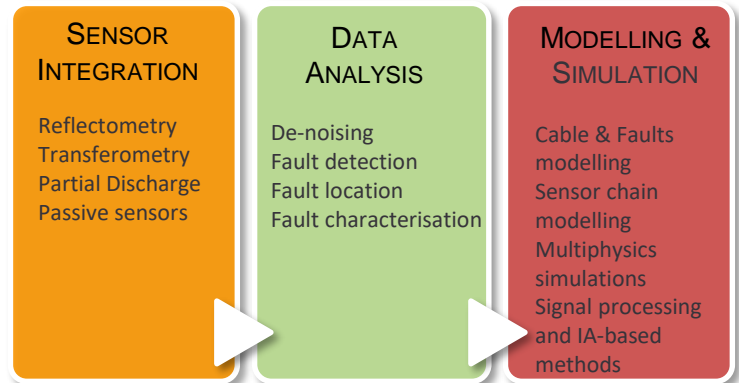

Reflectometry

DEFECT

Transferometry

TECHNOLOGY

HEALTH MONITORING (THROUGH OPTICAL FIBER SENSORS)

Key Features

- Development of Optical Fibers sensors and laser processes allowing multiple, distributed sensing along a single fiber, over small or large distances, even in harsh environments (high T°, cryogenic, high Pressure, radiation, submarine...)
- Non-destructive testing through Optical Fiber Multiplexed Bragg gratings
- Example of applications :
 - Pipe monitoring, pressure measurement without tapping for existing or new Oil & Gas installations, in liquid or gas ; erosion measurement in submarine parts
 - Fiber optic embedded in composite materials for life monitoring of Hydrogen tank

Temperature
4K – 1400K

Assets

- Sensors are engraved along the fiber through the protective sheath using a cutting edge CEA laser process, ensuring both high mechanical and thermal resistance
- Wide range of techniques available allowing for instance discrimination of temperature & strain

$$\frac{\Delta\lambda_B}{\lambda_B} = a\Delta T + b\frac{\Delta L}{L} + c\Delta P$$

Wavelength multiplexed Bragg gratings

SUCCESS STORY

NETWORK PIPELINES INSTRUMENTED FOR LEAK DETECTION

Implementation of a real-time monitoring and alerting tool for smart network management

Approach implemented :

- Signal processing for data cleaning
- Statistical modelling and machine learning for the detection of anomalies
- Confrontation with contextual data

DATA, AI & DIGITAL TWIN

1 For asset management

2 For Complex system optimization

3 For Decision making

4 For Prediction

TECHNOLOGY

DIGITAL TWIN
(FOR ENERGY
GRIDS)

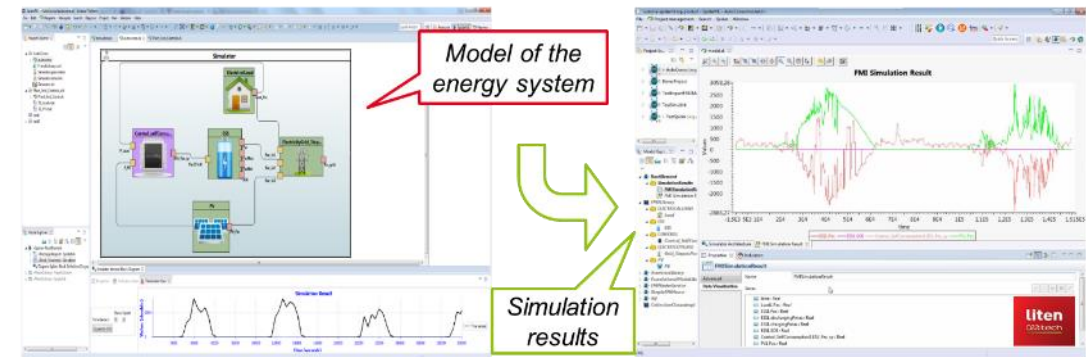

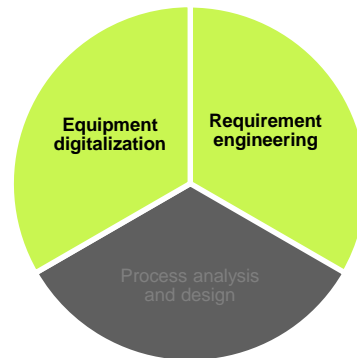

Key Features

- Simulate & optimize complex systems
- System verification assessments
- Monitoring (supervision at real time)
- Safety and security analyses
- Grid System architecture modeling
- Interface with equipment models & simulator
- Global Simulation orchestration

Assets

- Open and flexible modelling platform
 - Can be easily customized to fit in specific application
- Highly modular tool architecture

Cosimulate the heterogeneous models

DATA, AI & DIGITAL TWIN

1 For asset management

2 For Complex system optimization

3 For Decision making

4 For Prediction

TECHNOLOGY EXPERT SYSTEM (EXPRESSIF®)

Key features

- Expert system for Knowledge modelling
- Automated reasoning for decision making
- Application : Increasing the chance of relevant excavation for underground gas network pipe maintenance
 - In situ measurement of network data
 - Risk assessment
 - Development of the 300 rules
 - Optimizing rules
 - Development of an Human-Computer interaction system
 - Reasoned evaluation of Risk assessment
 - Rules modifications

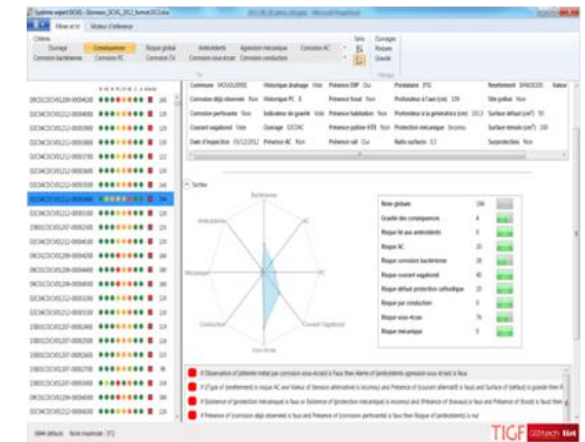

TIGF

Asset

- Less data needed than for machine learning (digital frugality)
- Explanability of decision
- 5 –fold increase of real positive

Success story

DATA, AI & DIGITAL TWIN

Smartgrid

TECHNOLOGY

HARDWARE
VULNERABILITIES
IDENTIFICATION

Key Features

- Conformity analysis of critical hardware
- Penetration test with beyond state-of-the-art attack Benches : invasive, fault injection, side-channels, software
- Characterisation tool to validate embedded systems security

CSPN

Integrated circuits and hardware components
Common Criteria up to EAL7

TECHNOLOGY

SOFTWARE
VULNERABILITIES
IDENTIFICATION

Key Features

- Next generation code-auditing tools
- Automated analysis platforms based on advanced reasoning, providing mathematics-based security proofs
- Deep code verifications based on advanced reasoning embed strong mathematical assurances within software development lifecycles
- Frama-C is used across CEA, and in software production processes across numerous industrial domains (transportation, energy, telecoms, industry, defense, ...)

Key Features

- Simulation & demonstration platform of an Industrial Control System
- Demonstration of attacks
- Testing efficiency of countermeasures at device level

PLATFORM

WONDERICS

SECURE

INDUSTRIAL IOT

(IIOT)

PLATFORM

TECHNOLOGY

SIGMO-IDS

ANOMALY-BASED NETWORK INTRUSION DETECTION & REACTION

Key Features

- Cognitive System for Network Intrusion Detection & Reaction (IDS) tailored to industrial applications
 - Neural-network –based “protocol-aware” intrusion detection at each probe
 - Orchestration of the overall (multi-probe) detection function, always fitted to the current context
 - DN-based control of the IDS probes
 - Dynamic reconfiguration of the network to counter the detected threats
- Implementations targeting multiple applications
 - Wireless IoT: 6LoWPAN, Zigbee, Thread, LoRA, BLE
 - Smart Grid: IEC 60870
 - Industry 4.0: OPC-UA

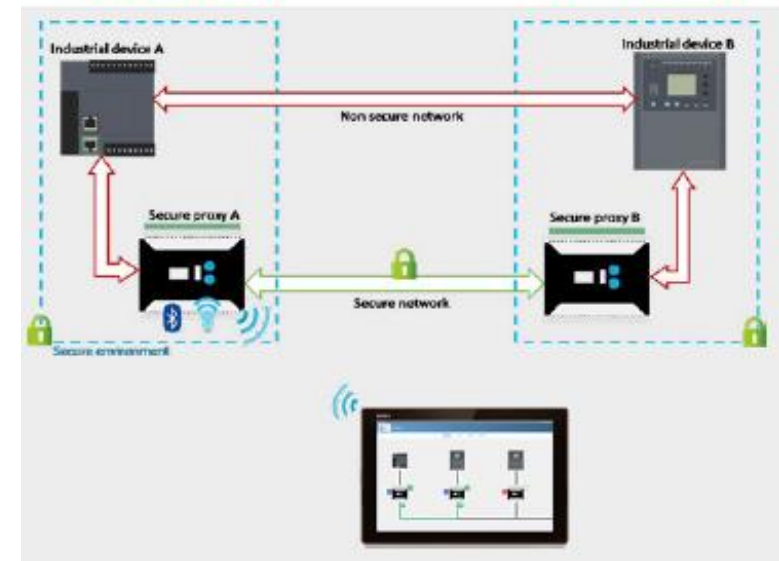

TECHNOLOGY
ARGOS
RETHINK AND
SIMPLIFY
SECURE
INDUSTRIAL IOT
(IIOT)
DEPLOYMENT

Key Features

- a 3-in-1 solution to improve manageability, sustainability and ergonomics
 - A **secure proxy** for securing existing industrial networks initially based on insecure communication protocols, limiting attacks through service denial & detecting attacks in real time
 - A **supervision solution** with secured end to end communication protocol, a simplified deployment of a configuration in an IIOT network via a mobile phone.
 - “**Hardware in the loop**” architecture integrating simulation of industrial processes and specific attacks.

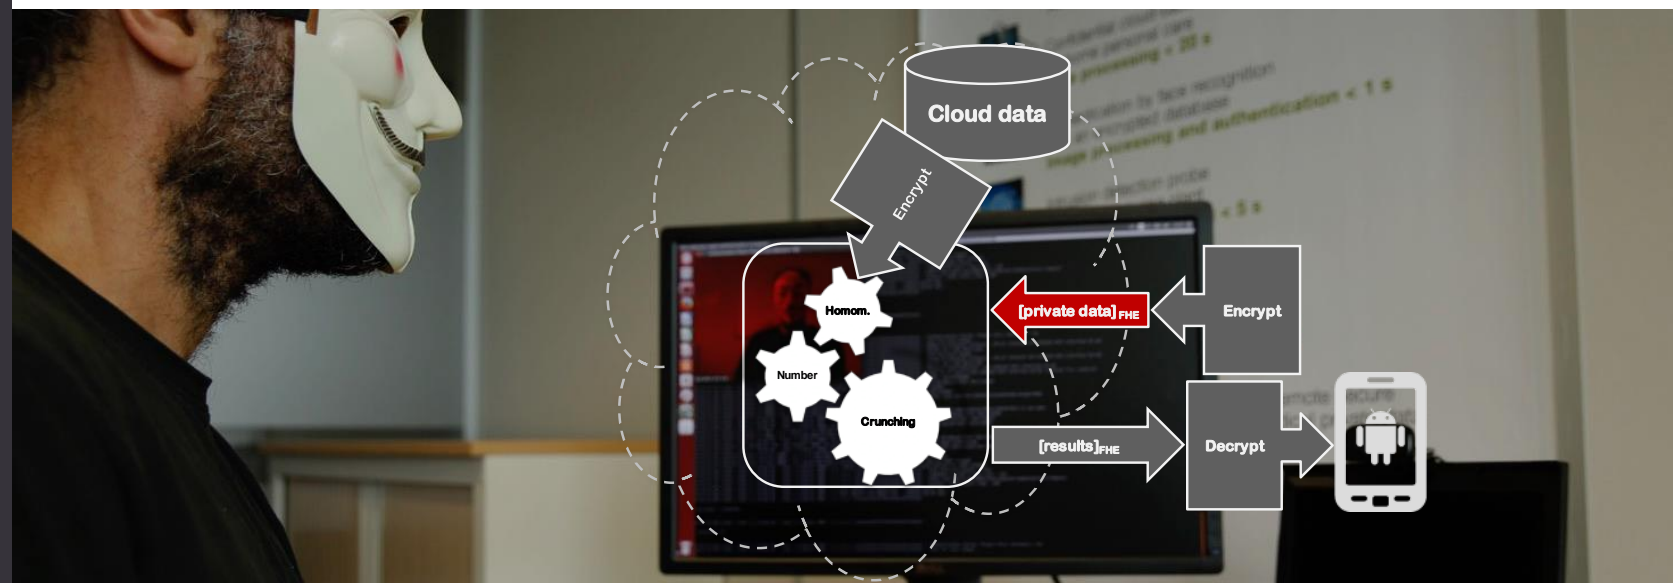

TECHNOLOGY

CINGULATA

TOOLCHAIN,
ENABLING
END-TO-END
ENCRYPTION

Key Features

- Help software developers integrate homomorphic encryption techniques in their apps. Optimize the performance of these operations
- The world's leading compilation toolchain is developed at CEA, allowing engineers to optimize and deploy homomorphic cryptography in real-world applications
- CEA Teams have breached sub-second trans-cyphering capabilities, an essential step for homomorphic deployments to interoperate with legacy environments

TECHNOLOGY

TRUSTED LEDGERS

FOR DATA AND
SERVICE
INTEGRITY

Key Features

- Distributed cryptographic protocol enable tamper-proof and undeniable registration of transactions
- Gaining trust in secure distributed protocols
- Design new protocols
- Prototyping trusted service
